# DoD Digital Engineering Challenges

## Model-Analyze-Build

**Late Discovery** of Design Errors in DoD Systems is very costly.

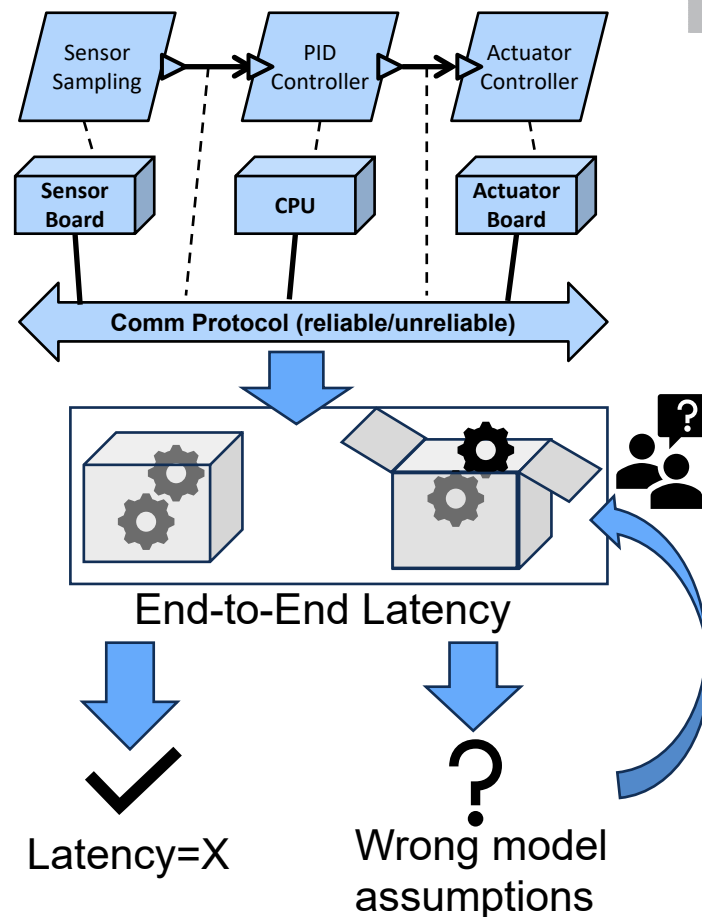

Architecture modeling and analysis can **detect** design **error early**

**BUT:**

Analysis assumptions are often implicit if analysis **assumptions not met**: analyses break down for reasons not clear to users of analysis tools.

E.g., e2e Latency Assumption: periods multiple of each other (harmonic)

**DoD barrier for adoption**

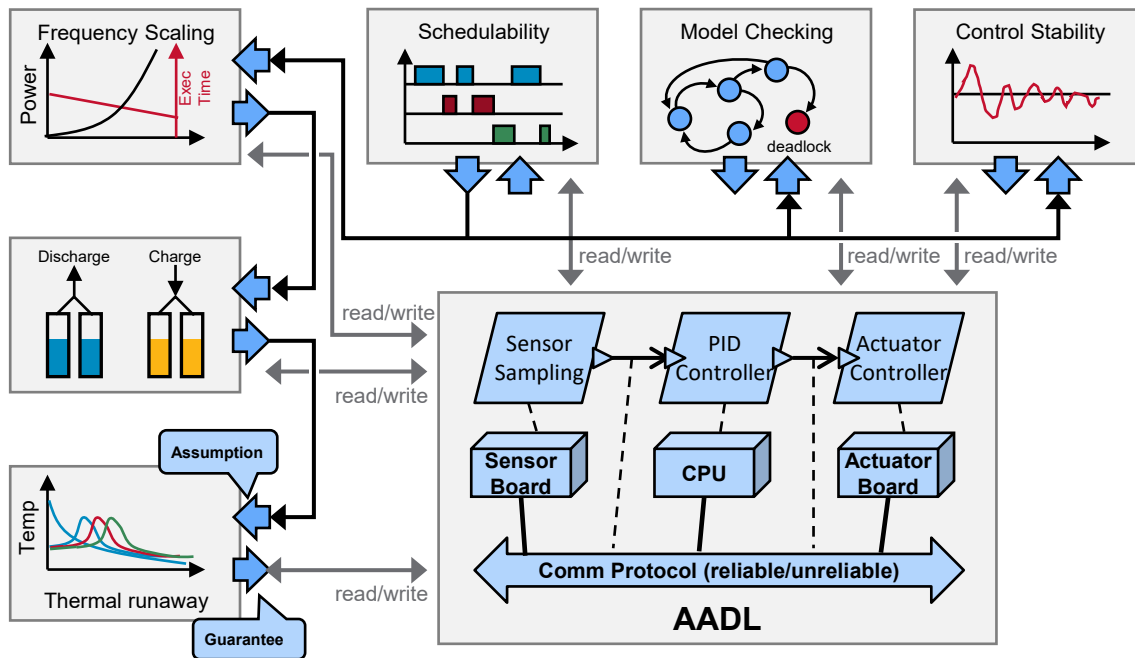

# Digital Engineering: Multiple Claims – Multiple Analyses

## Different Assurance Claims

- Combine multiple analysis
- Validate assumptions
- Resolve assumption conflicts

Integrate into arguments to satisfy claims

# Analysis Contract: Tracking Assumptions and Guarantees

**contract** {

**input:**

E2ELatencies

**assumptions:**

areConnectionsDelayed()

areDeadlinesConstrained()

areTasksSchedulable()

areAllThreadsPeriodic()

**analysis:**

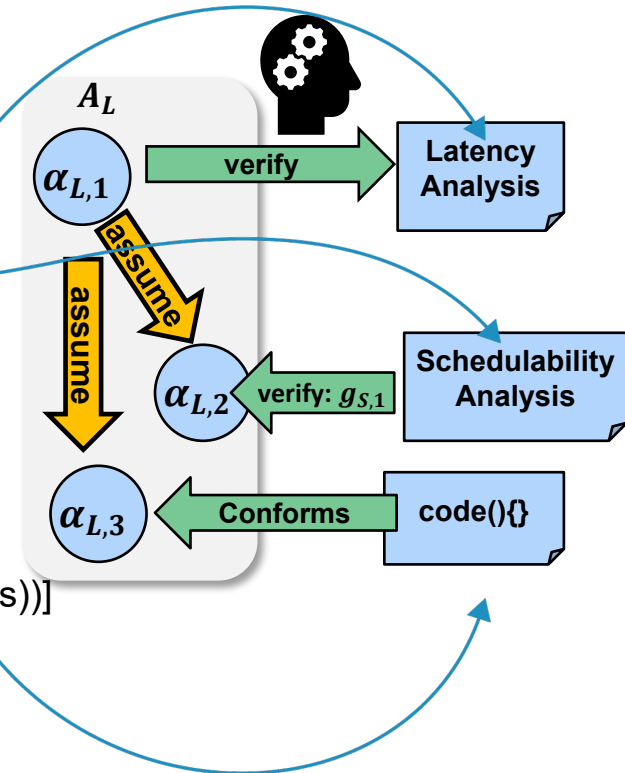

meetEndToEndLatencies()

**guarantee:**

[E2EResponses[i] <= E2ELatencies[i] for i in range(len(Responses))]

}

$$C_L = (A_L, G_L) \text{ with } A_L = \{\alpha_{L,1}, \alpha_{L,2}, \alpha_{L,3}\}$$

# Shift Left And Down to the Implementation

## Early Analysis

- Evaluate design decisions with partial information
- E.g., latency analysis before periods
  - periods of tasks must be multiples of each other

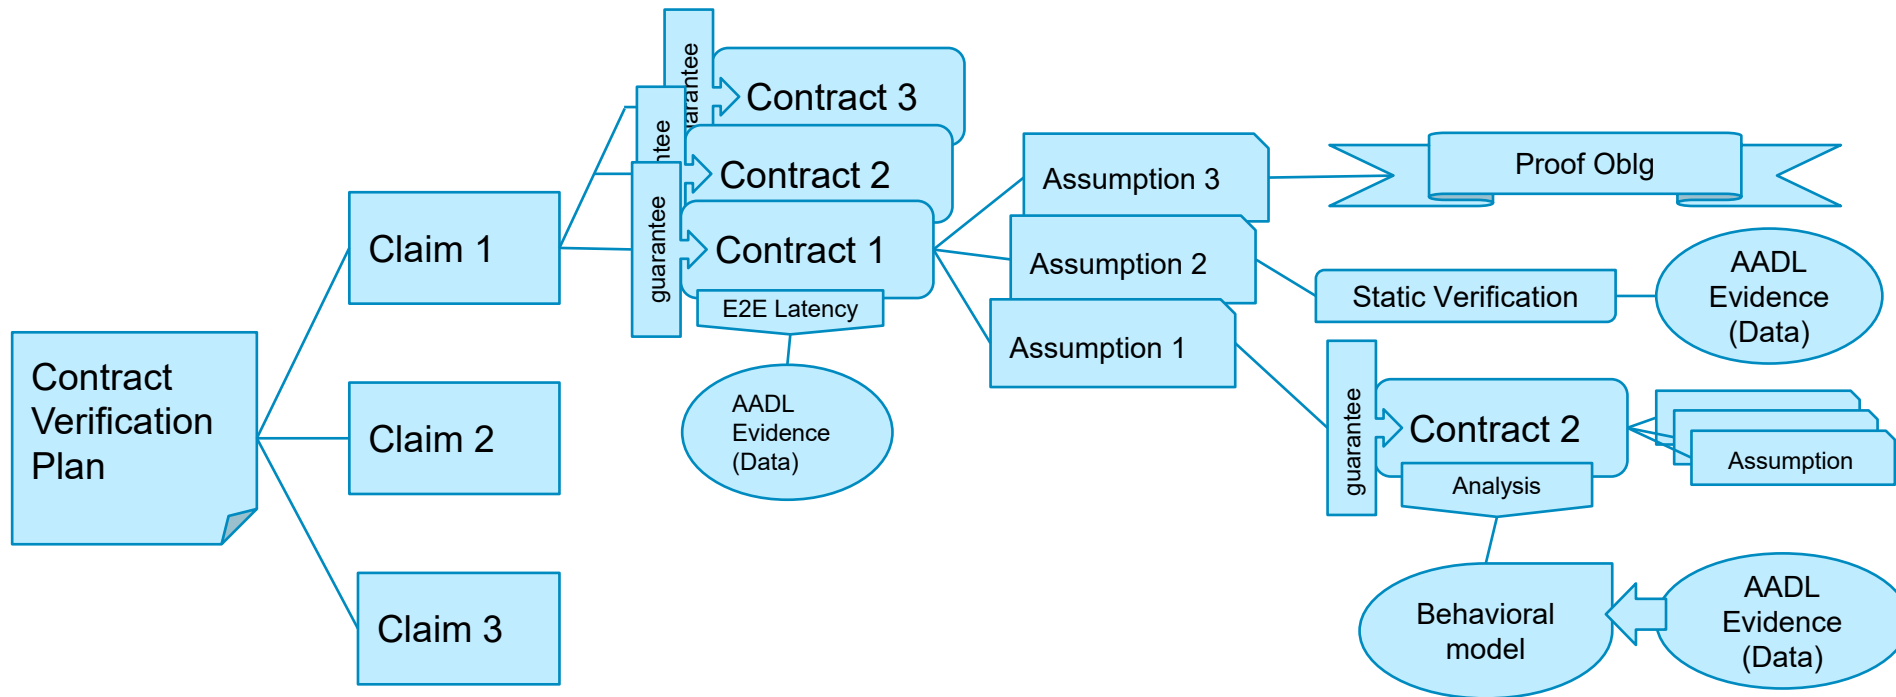

## Refinement

- Track pending information
  - periods
- Track and execute pending verification
  - Schedulability

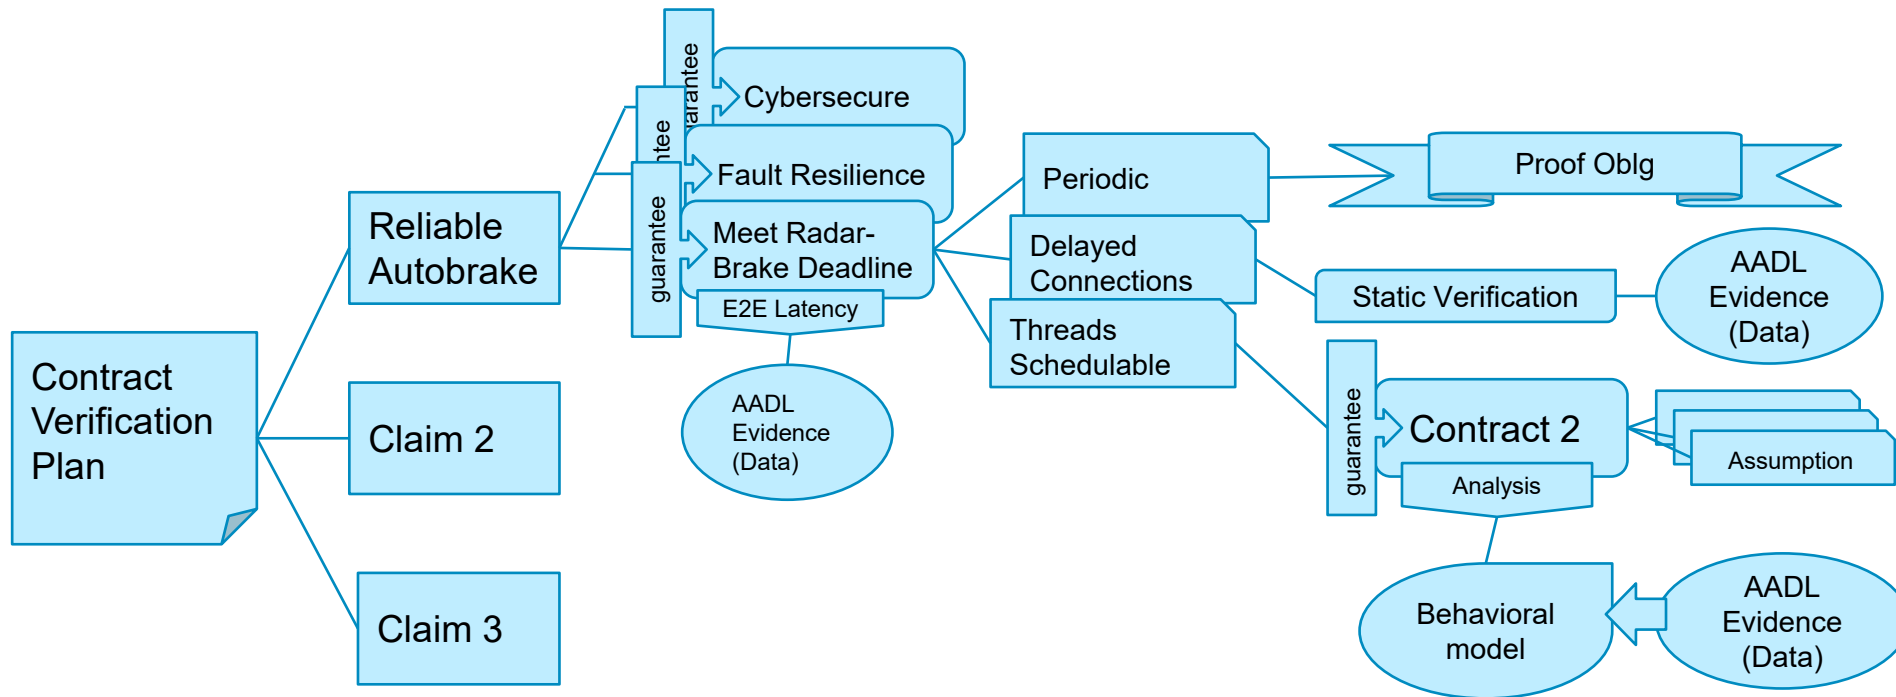

## Conformance

- Track implementation assumption
- Verify implementation conformance
  - Task executed strictly periodic  $\alpha_{L,3}$

# Assurance Contract Argumentation (1)

# Assurance Contract Argumentation (2)

# Contract Argumentation in the Development Lifecycle

## **Integrity of Analysis**

- Verify assumptions
  - Detect violation
  - Suggest repairs
- Offer alternative analysis that satisfy assumptions

## **Refine Design**

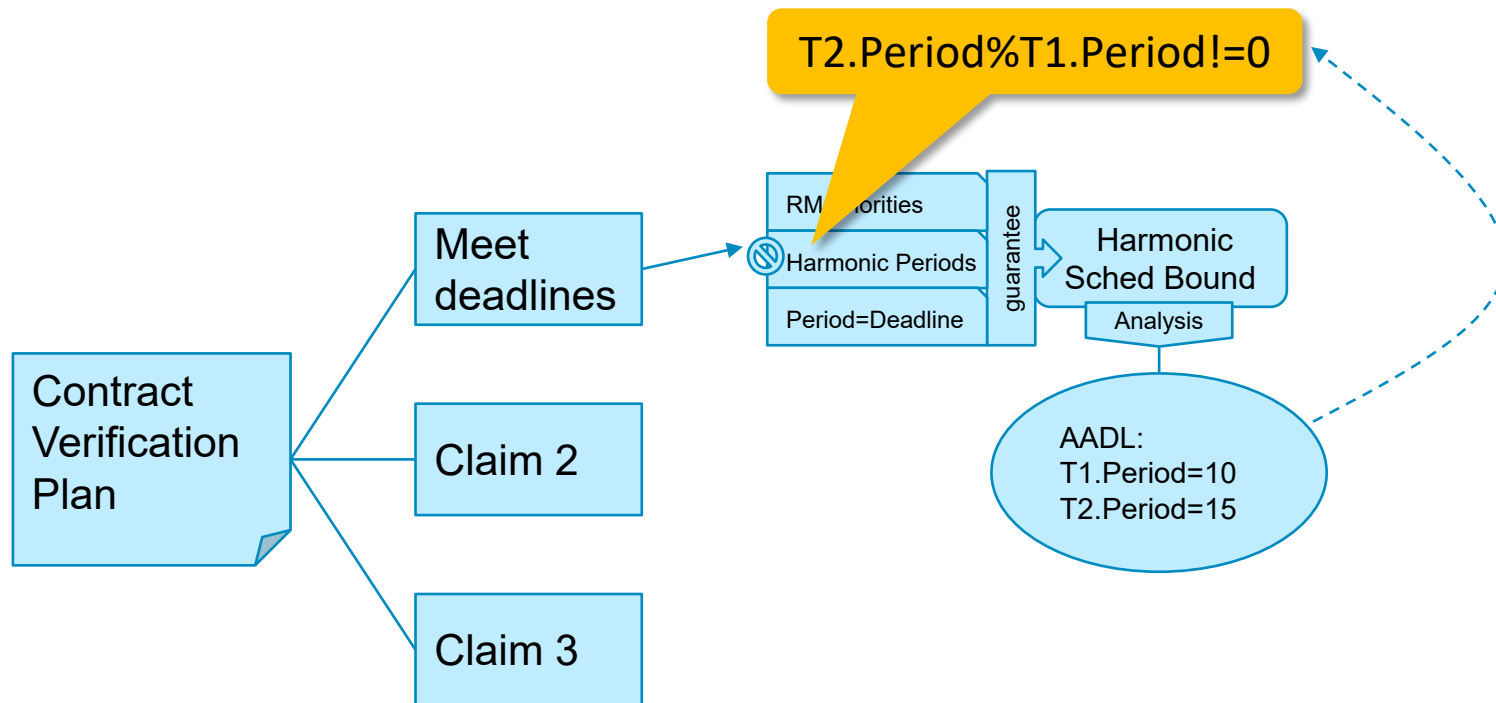

- When enough new data for new analysis
- When new data affects proof obligations

## **Argument reusability**

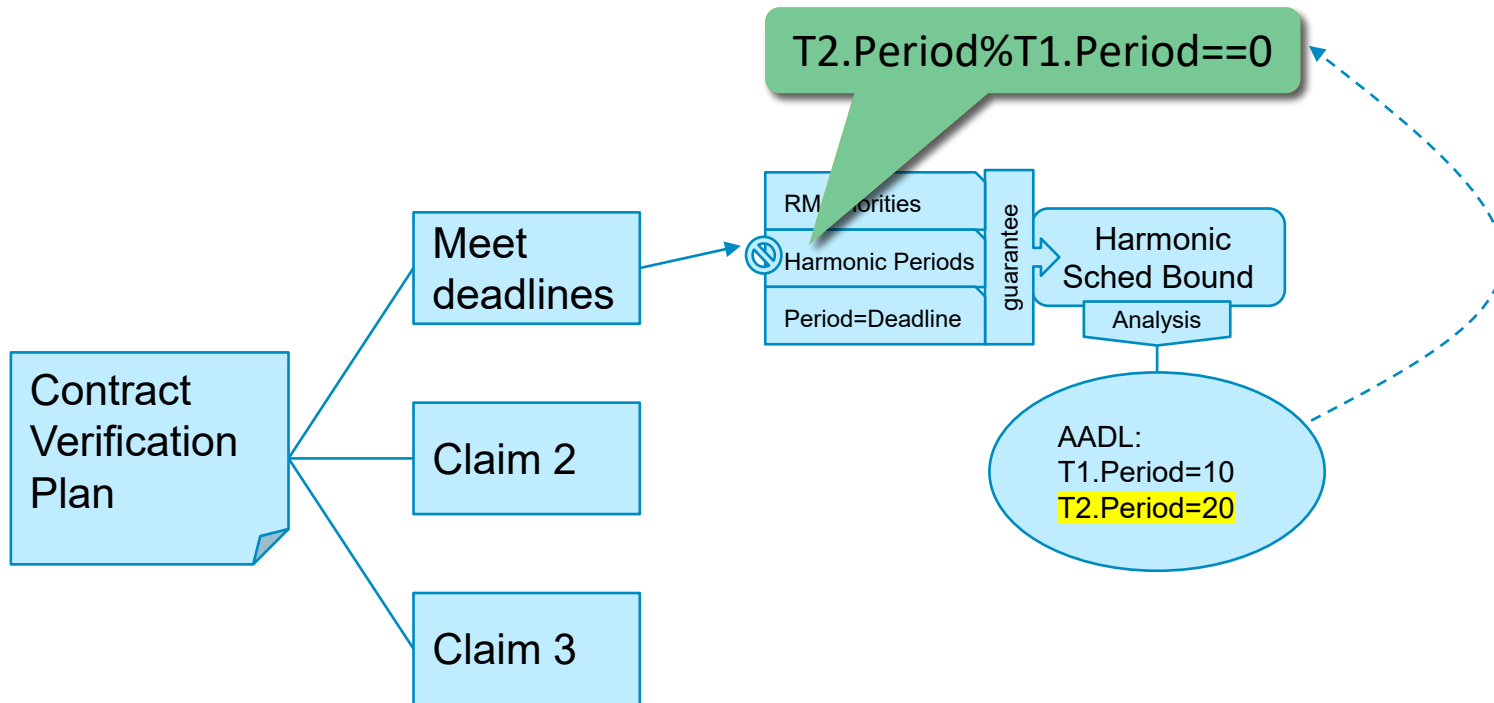

- Self-contained modular analysis contracts

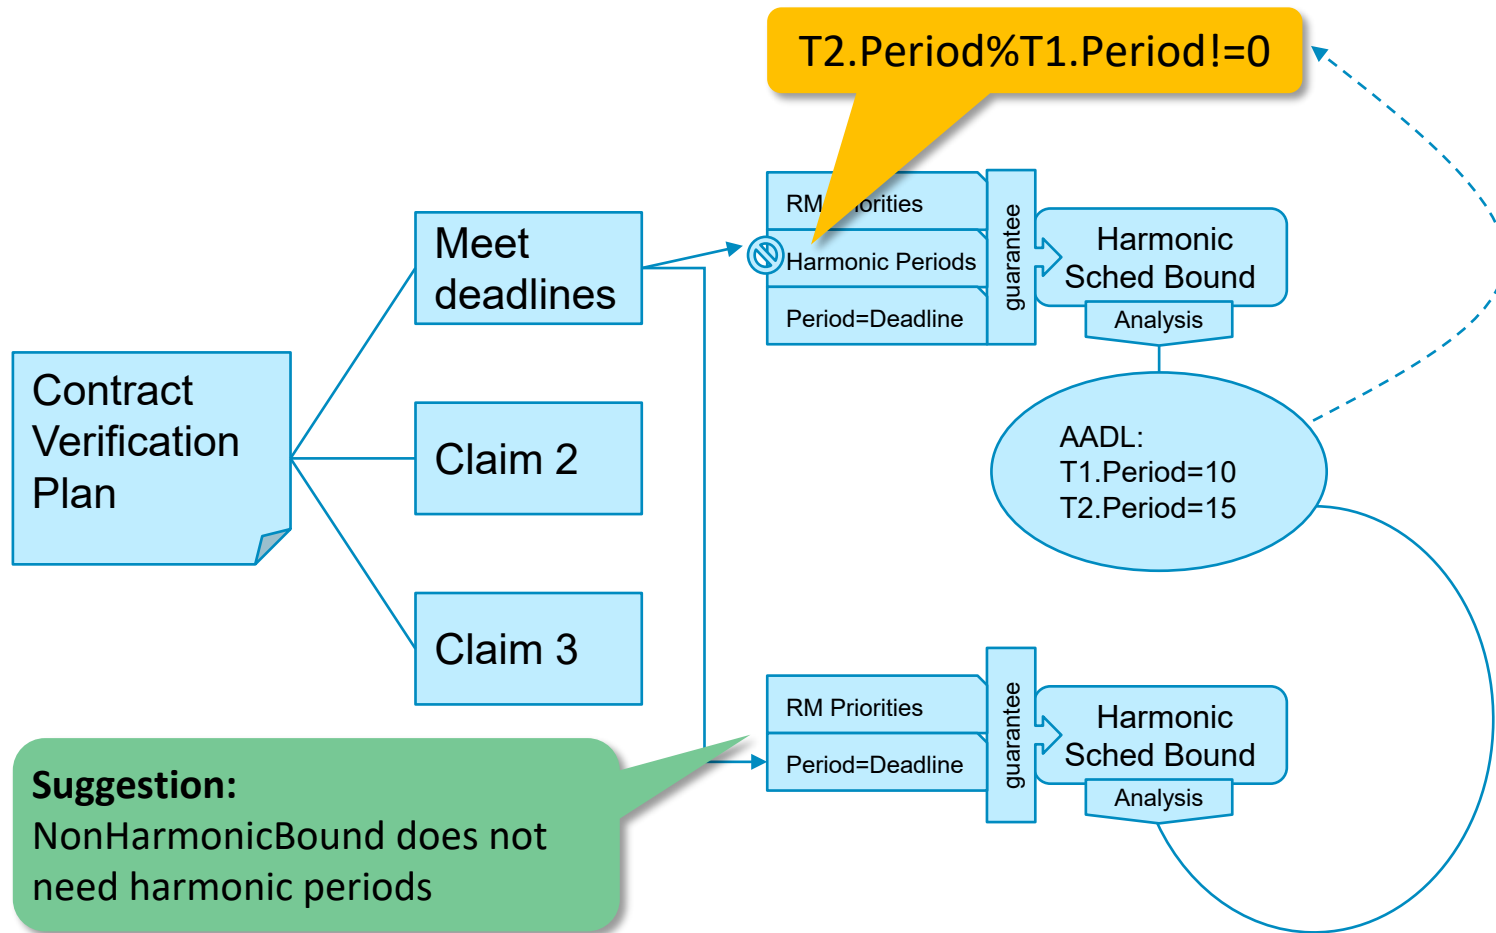

# Integrity of Analysis: Repairing Assumptions (1)

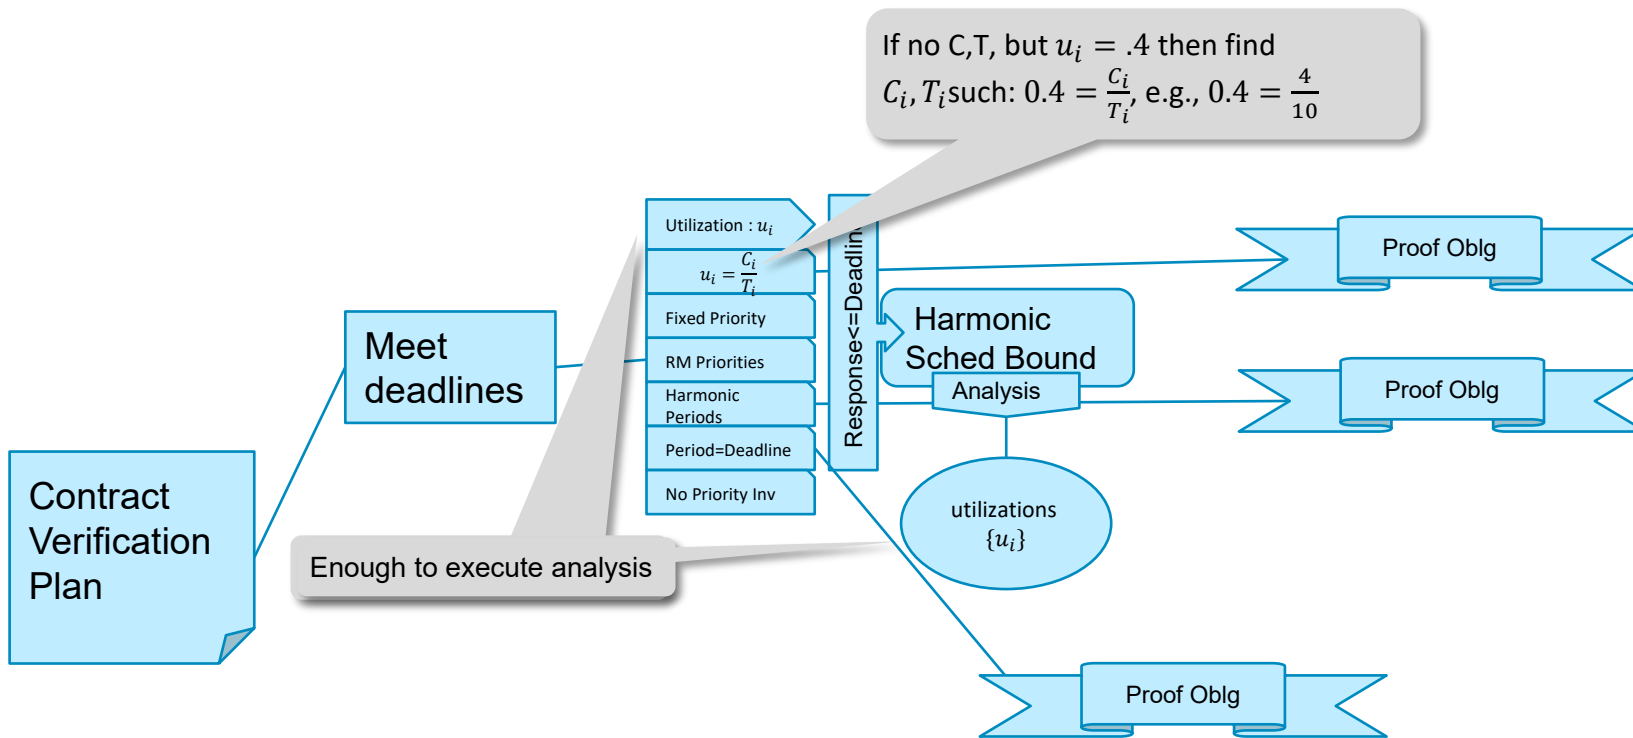

# Integrity of Analysis: Repairing Assumptions (2)

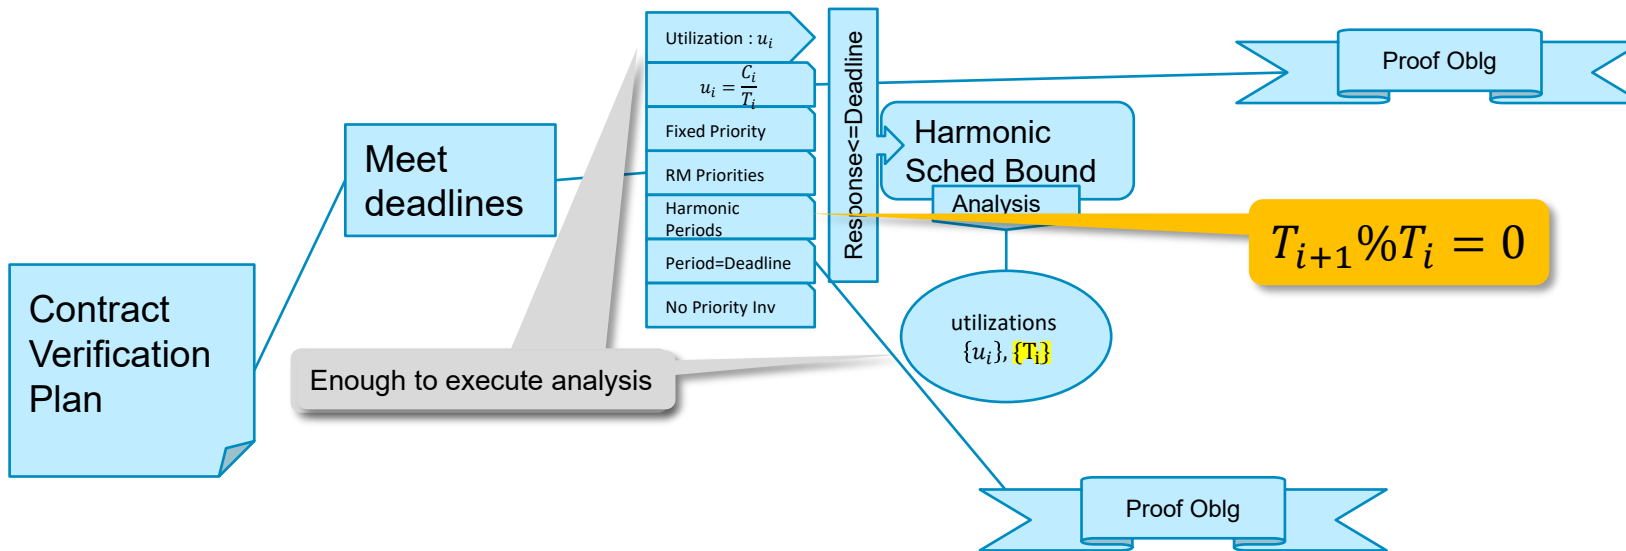

# Integrity of Analysis: Repairing Assumptions (3)

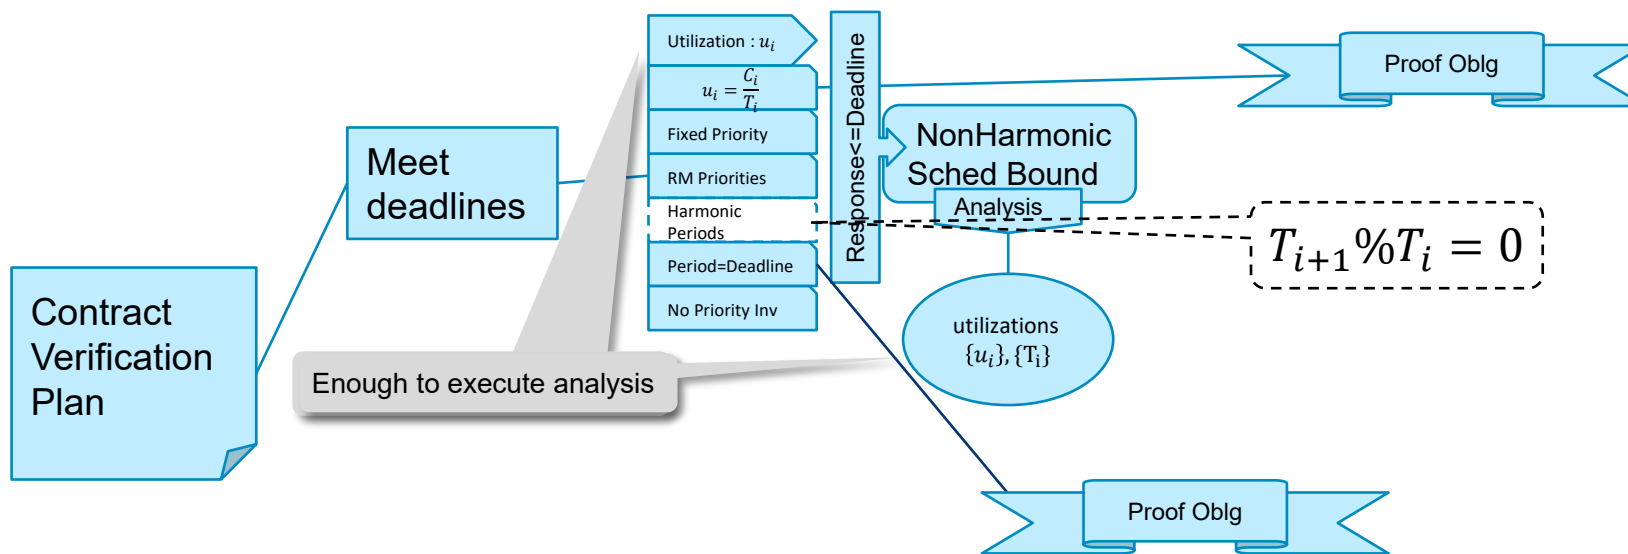

# Refinement Throughout Development (1)

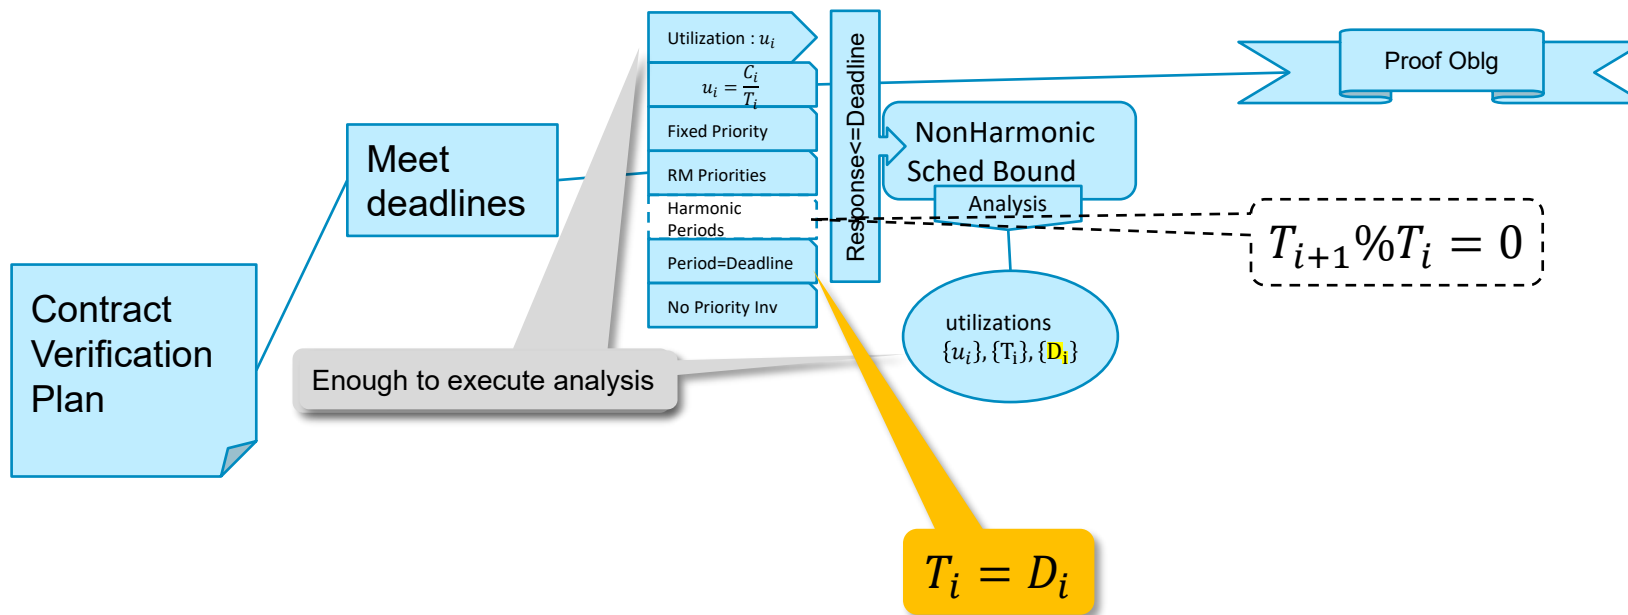

# Refinement Throughout Development (2)

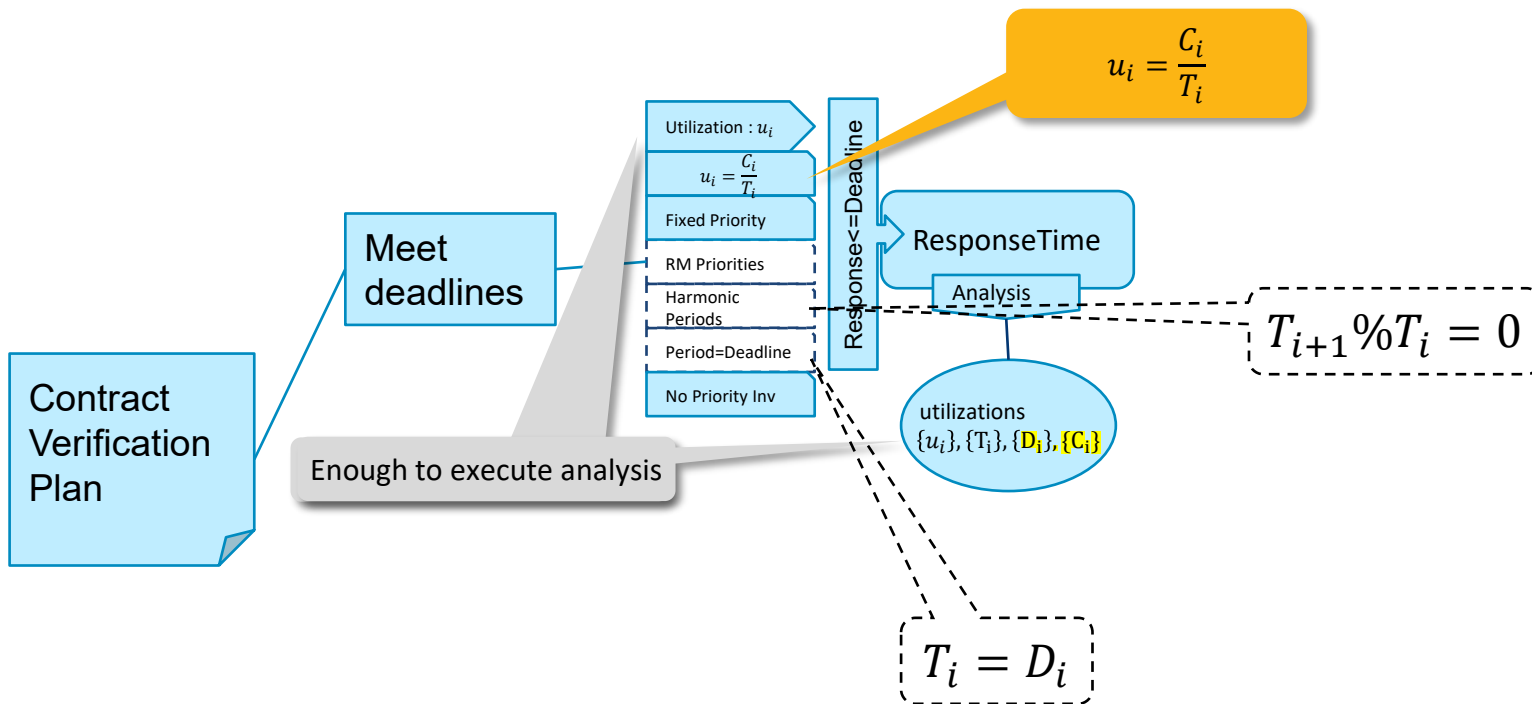

# Refinement Throughout Development (3)

# Refinement Throughout Development (4)

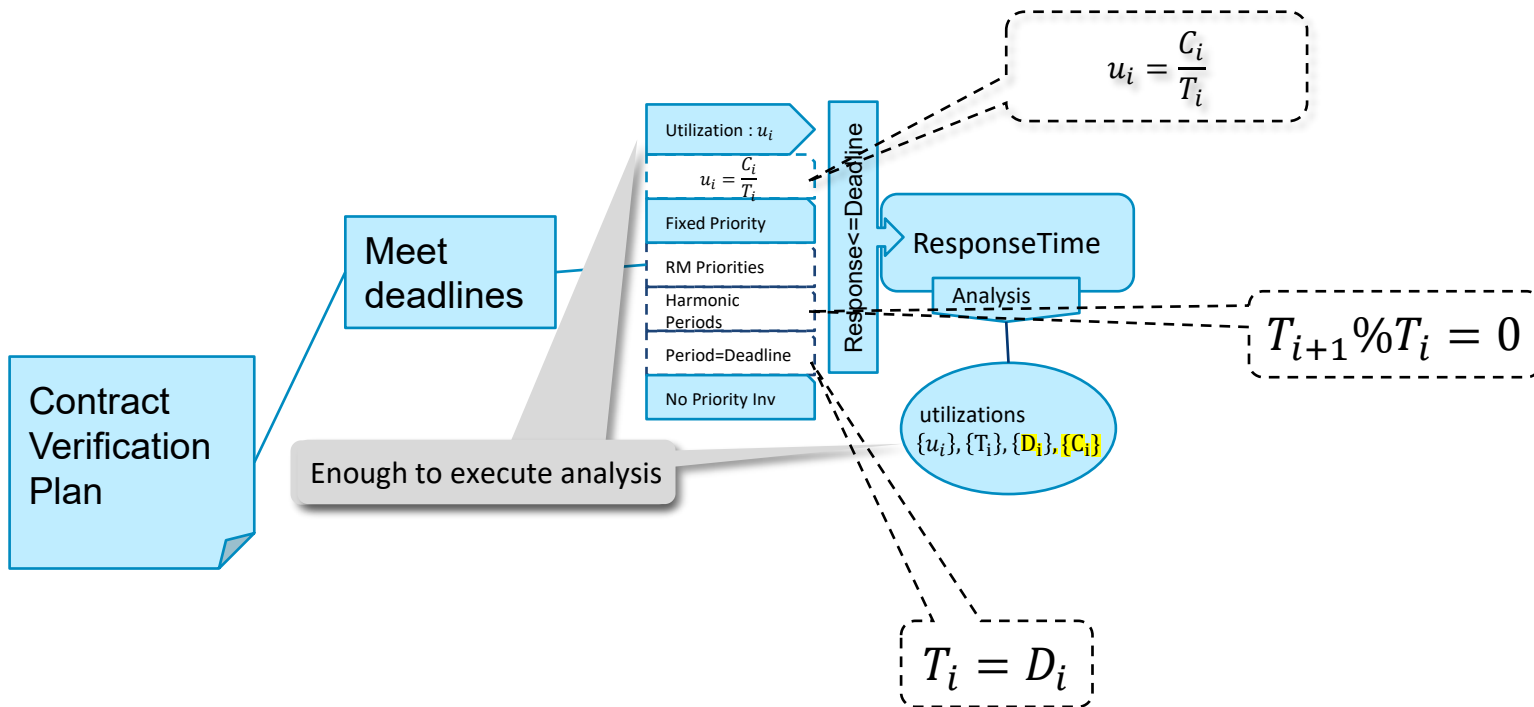

# Refinement Throughout Development (5)

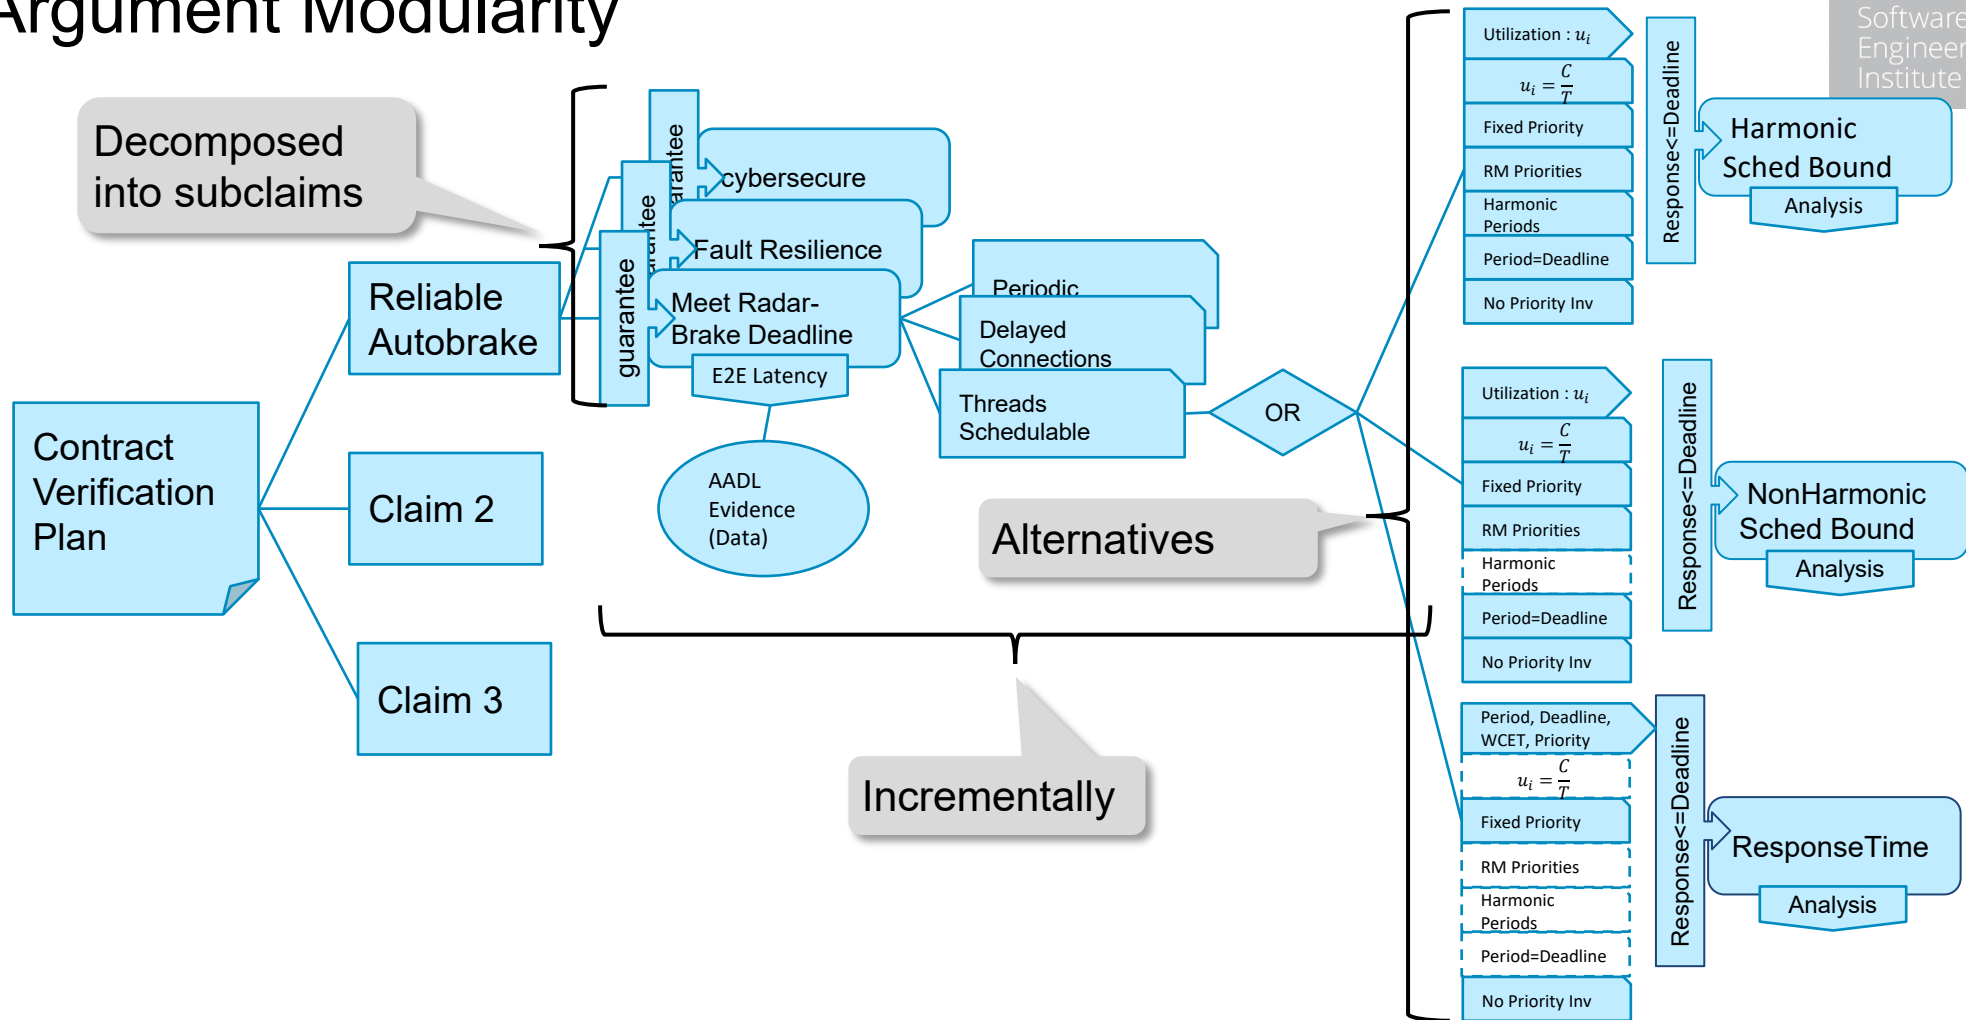

# Refinement Throughout Development (6)

# Argument Modularity

# Implementation: Symbolic Contract Argumentation

## Assumptions

- Constraints that must be satisfied for a valid analysis

## Analysis

- Evaluate whether the guarantee can be discharged

## Guarantee

- Assertion presented as a true fact on model

## Implementation

- Constraint Satisfaction Solver (Satisfiability Modulo Theories – Z3)
- Implements contract argumentation
  - Evaluate whether constrains can be satisfied with facts from analysis guarantees
- Validate assumptions
  - Proof obligations: lack of constraints allow any value that satisfy assumption (e.g., RM priorities)

## Artifacts

- Annex language hosted in AADL/OSATE
  - Model Query Language adaptable for multiple modeling language (e.g., SysML V2)
- Automatic Execution of Contract Verification Plan
  - Assumption repair & analyses alternatives

# Contract Argumentation Scalability

## **Exploit Knowledge from Scientific Domain**

- Efficient algorithms from specialized domains
  - E.g., greedy worst-case response time in real-time theory
  - Implemented in imperative languages

## **Assume correctness of analysis**

- When validating the contract argumentation
- Enables connection with other lower-level verification results
  - E.g., PROSA: coq (theorem prover) verification of real-time theory

## **Correctness of implementation**

- Exploit proven properties of runtime mechanisms: e.g., schedulers, hypervisors
- Exploit code generation
- Deferred code verification to conform to assumptions

# Impact

## Certification

- Automated and sound verification of assurance claims through models

## Fielding Speed

- Automated assurance watchdog
  - Validate incremental refinement through design
- Concurrent formal assurance argument construction and system development

## Digital Engineering and AADL Ecosystem

- Incremental sound analysis infrastructure to DoD modeling efforts
- Architecture-Centric Virtual Integration Practice (ACVIP) within FVL
- DARPA programs using AADL

# Concluding Remarks

## Certification in Digital Engineering Era

- Follow model-analyze-build
  - Automated argumentation supported by model-based analysis contracts

## Shift Left

- Start verifying early design decisions
- As design is refined
  - Ensure properties of pervious design decisions are preserved
  - New refinements can provide additional evidence / properties to support assurance

## Down To The Implementation

- Drive properties & assumptions down to the implementation

## Scalable

- Exploit efficient analysis from different domains

## Sound

- Exploit advances in formal verification
  - Combination of analysis, verification of assumptions, implementation compliance, analysis correctness

# Team

**Bjorn Andersson**  
Principal Researcher

**Jerome Hugues**  
Senior Researcher

**Sam Procter**  
Senior Researcher.

**John Hudak**  
Principal Engineer

**Sholom Cohen**  
Principal Engineer

**Lutz Wrage**  
Senior Researcher

**Aaron Greenhouse**  
Senior Researcher

**Ruben Martins**  
Research Professor CMU/CS

**Gabriel Moreno**  
Principal Researcher

**Joseph Seibel**  
Software Engineer

**Dionisio de Niz**  
Technical Director ACPS.
