Introduction to ASP OAR Pilot

Options Analysis for Reengineering (OAR) is a systematic, architecture-centric method for identifying and mining reusable software components within large and complex software systems.

OAR was initially developed for organizations that own both the legacy assets and the target system

ASP OAR pilot provided a customized version of OAR for the FCS system integrator to quickly evaluate whether specific legacy assets can be effectively mined for reuse within FCS.

Context: Why Mine Existing Components?

Few systems or product lines start from “green fields”

Problem of mining existing components:

- under what conditions should components be extracted
- what types of components are worth extracting
- issues in extraction:
 - existing components are often poorly structured and poorly documented
 - existing components differ in levels of granularity
 - organizations lack clear guidance on how to perform the salvaging

Bottom line: it is difficult to get off the dime!

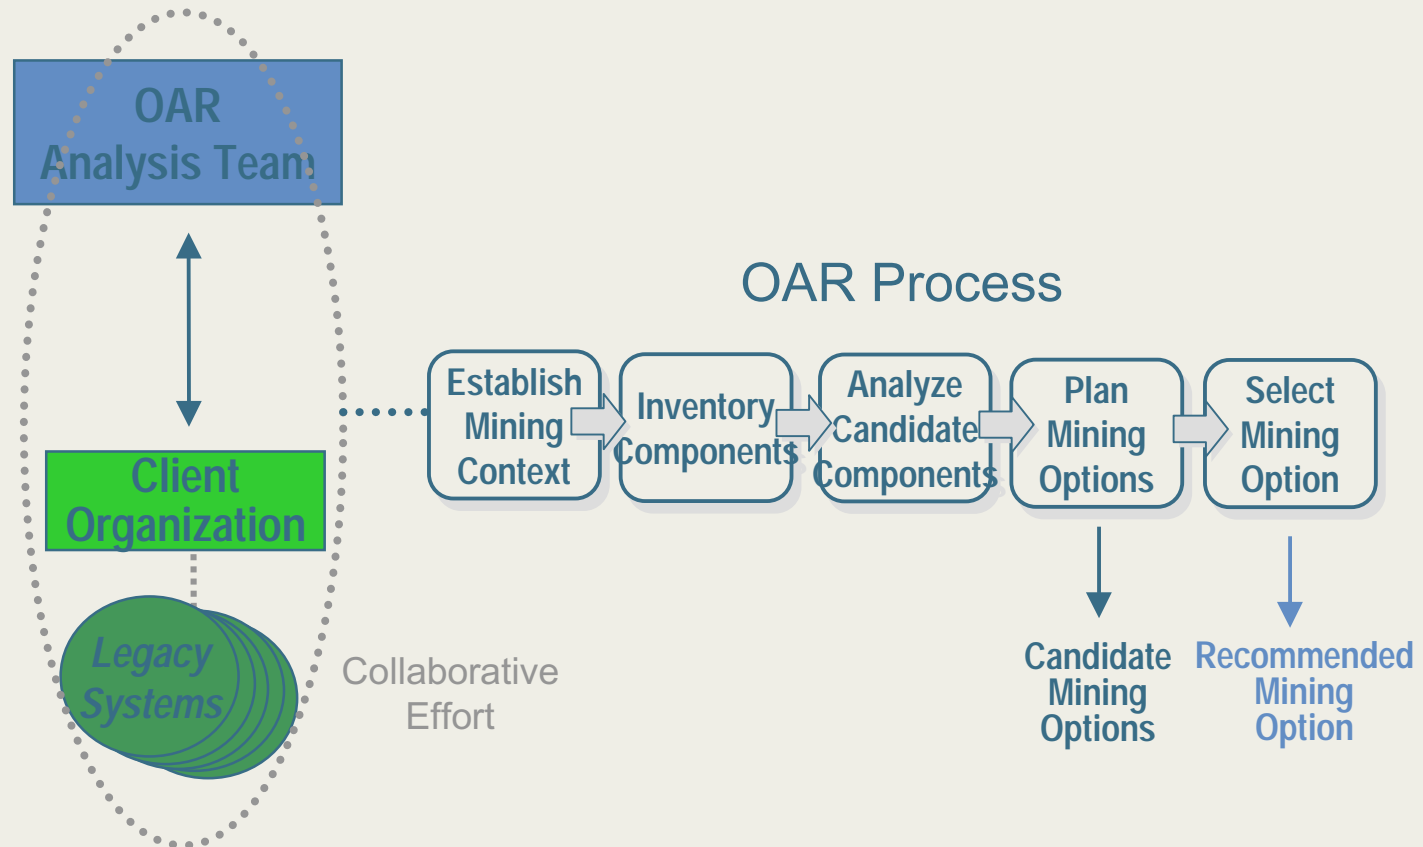

What OAR Provides

OAR provides:

- quick identification of relevant and non-relevant components
- decision making based on consensus and “hands-on” analysis
- identification of target component needs that can be satisfied and those that cannot be satisfied
- estimates of the cost and risk of changes required to each legacy component to satisfy a product line need

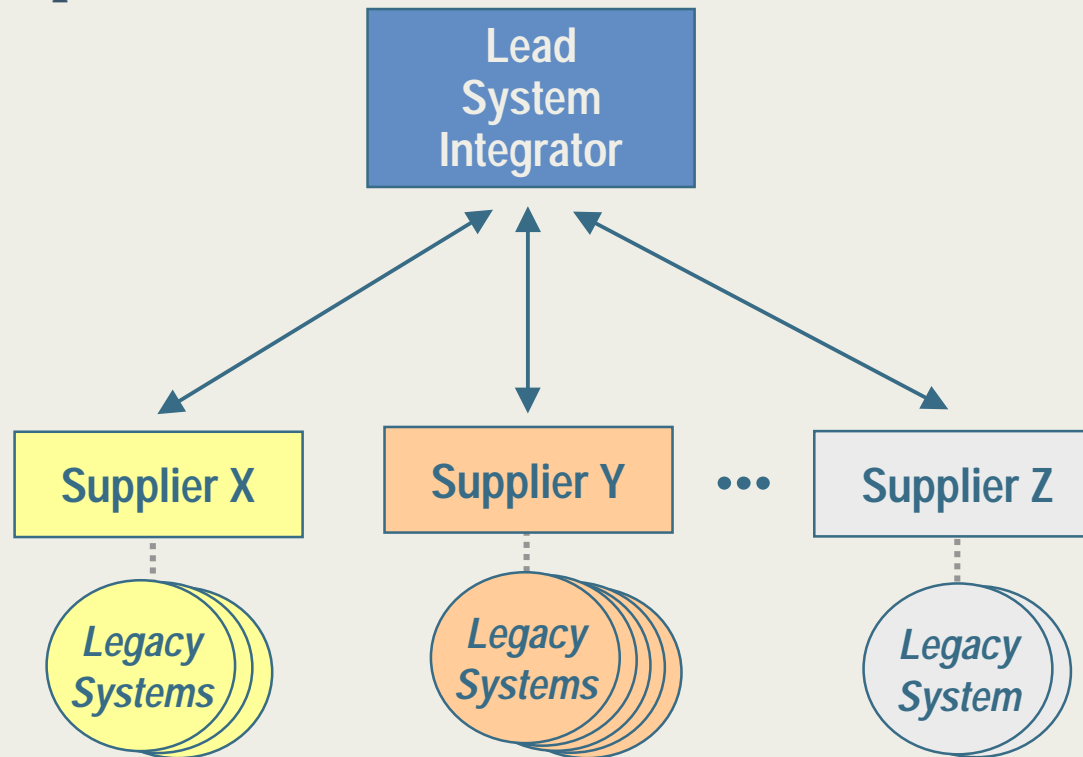

Conventional Application of OAR

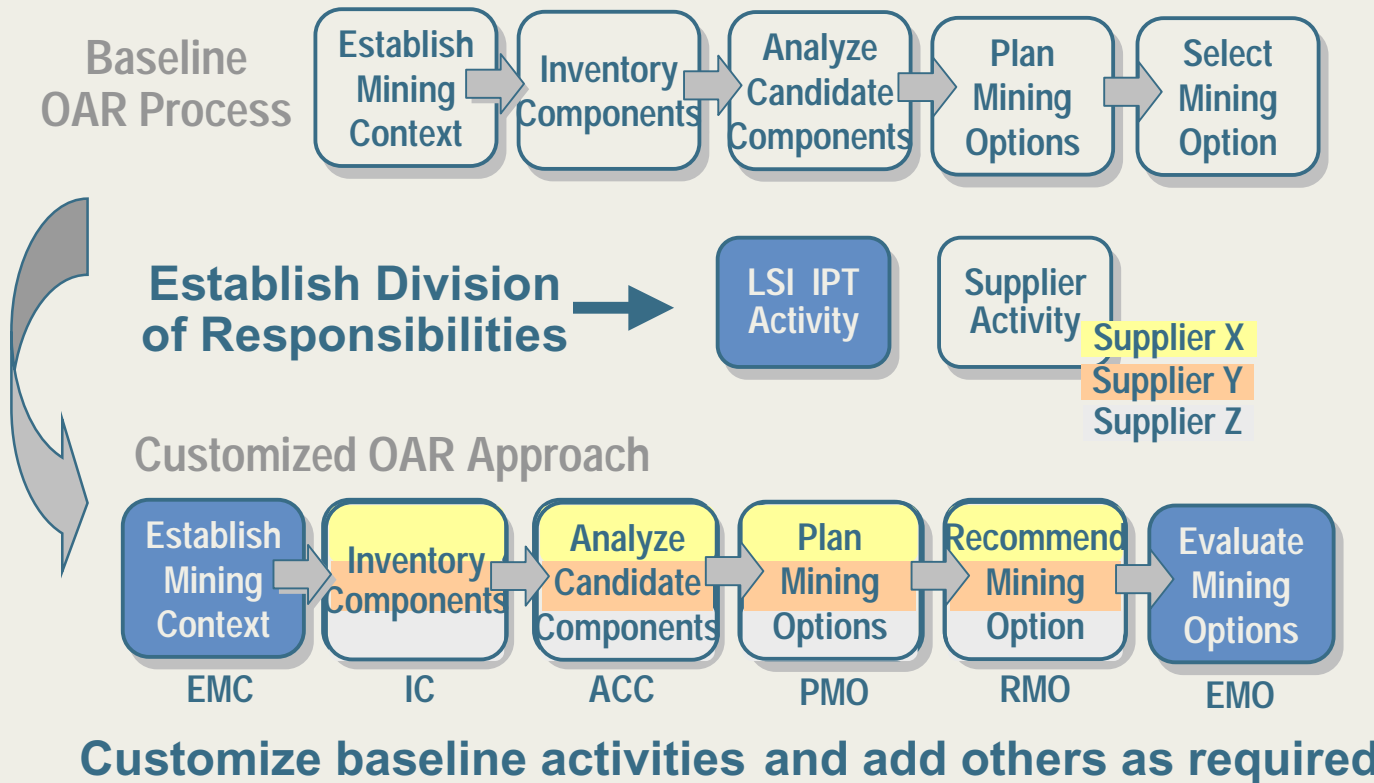

Multiple Supplier Context for Applying OAR. Lead System Integrator (LSI) Integrates Components From Various Sources

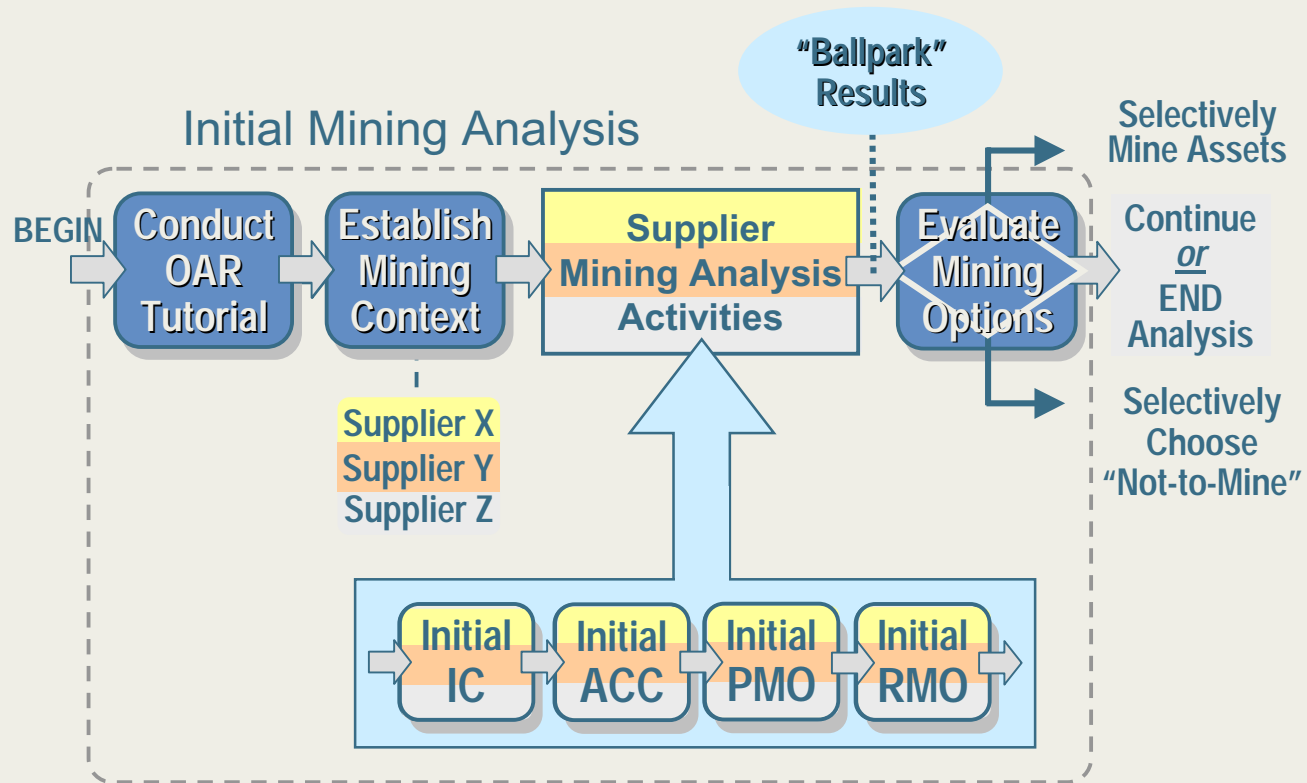

“Divide and Conquer” Approach

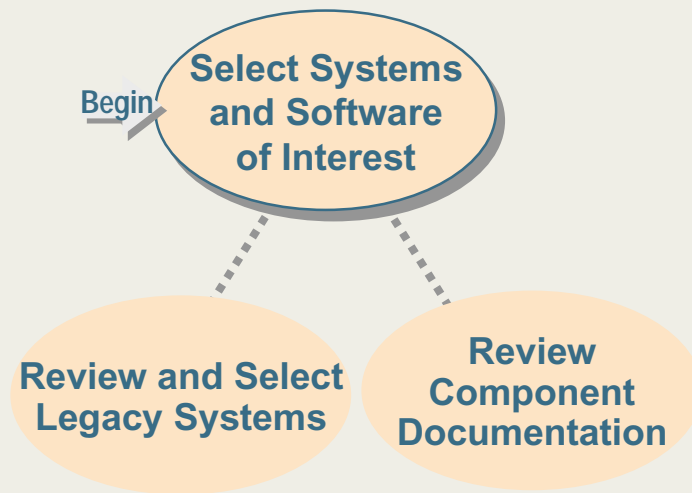

Phase 1 Activities

Component Table

New System Component Need		Required Common Component Characteristics					
Legacy System Software Components		Programming Language	Source Size Lines of Code	Number of Modules	Structured Code		
Name of Component Need	Component Name(s)	<entry>	<entry>	<entry>	<entry>		
		Other Pertinent Component Characteristics					
		Age (Years)	Compilation Environment	Complexity	Coupling	Cohesiveness	
		Rehabilitation Characteristics					
Black Box White Box Suitability	Level of Changes Required	Level of Granularity	Support Software Required	Level of Difficulty	Level of Risk	Mining Effort (MM) Required	Mining Cost Estimate
New Development Estimates				Comparative Data for Mining			
Effort (MM)	Cost (\$K)	Level of Difficulty	Level of Risk	Relative Cost	Relative Effort	Relative Difficulty	Relative Risk

EMO: Evaluate Mining Options

LSI OAR Phase 2 Activities

Outcome of Disciplined Reuse Decision-making Process

RESULTS

- ⇒ **Findings describing results of analyses**
- ⇒ **Description of each option with ranking**
- ⇒ **Rationale for option or combination of options selected**
- ⇒ **Cost and effort of selected mining options**
- ⇒ **Final list of satisfied and unsatisfied component needs corresponding to options selected**

Impact of LSI OAR Approach

The benefits of the LSI approach include:

- **Work is allocated corresponding to a natural division of responsibilities (i.e., who is in best position to perform activity).**
- **Obtaining early “Ballpark” results will speed up decision making process.**
- **Fewer LSI resources (manpower and time) required to complete the mining analyses resulting in reduced cost.**
- **In-Depth analysis accommodates desired refinement of analysis results.**
- **Common process will ensure consistency of results and equitable evaluations.**
- **Process focuses on what needs to be done -- suppliers have freedom to decide how to best perform the prescribed activities/tasks and collect the needed data.**

More planning and coordination though are required by the LSI.

Results of Pilot

- The pilot was performed on a small set of reusable assets. The results provided more credible reuse estimates.
- The LSI has adapted the general OAR approach, but has permitted suppliers to use their own specific processes to produce the OAR outcomes.
- The results were fed into the COCOMO II estimating model. Follow-up work is analyzing how to systematically connect OAR with COCOMO II.
- Government acquisition officers view the method as a mechanism for getting better metrics as well as better estimates.
