Societal Problems

Climate change and the environment

Powering our civilization

Disease, epidemics, and health care

Livable megacities

Safety and security

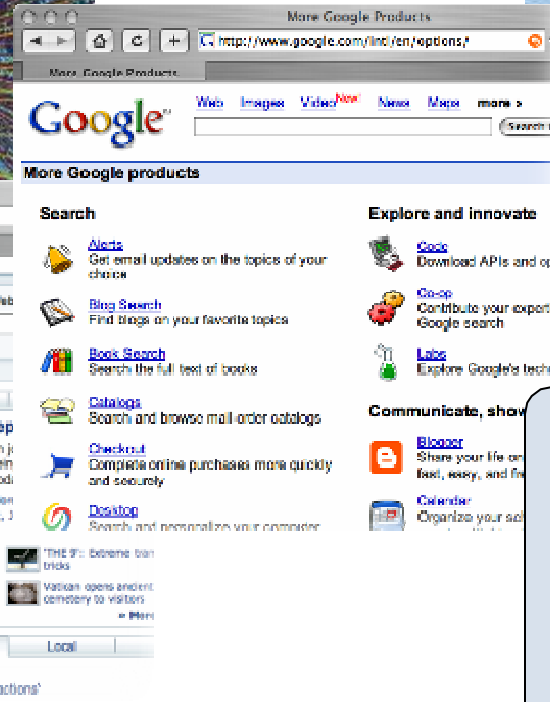

Transportation

Society's Dependence on Software

Trend Toward Increasing Scale-1

- Enormous web service and computing infrastructure
- Supply chain systems
- Software-based engineering systems

Trend Toward Increasing Scale-2

Healthcare Infrastructure

Trend Toward Increasing Scale-3

Homeland Security

Trend Toward Increasing Scale-4

Networked Automobiles

Trend Toward Increasing Scale-5

Saving the Environment

Increasing Scale In Military Systems

Increasingly Complex Systems

- ultra-large, network-centric, real-time, cyber-physical-social systems
 - thousands of platforms, sensors, decision nodes, weapons, and warfighters
 - connected through heterogeneous wired and wireless networks

Goal: Information Superiority

- *Transient and enduring resource constraints and failures*
- *Continuous adaptation*
 - changes in mission requirements
 - changes in operating environments
 - changes in force structure
 - perpetual systems' evolution
 - addition of new systems
- *Sustainable - legally, technically, politically*

The Challenge

*The Honorable
Claude M. Bolton, Jr.*

“Our soldiers depend on software and will depend more on software in the future.

The Army’s success depends on software and the software industry.

We need better tools to meet future challenges, and neither industry nor government is working on how to do things light-years faster and cheaper.

How can future systems, which are likely to be a **billion lines of code**, be built reliably if we can’t even get today’s systems right?”

— Asst Sec Army Claude Bolton
August 16, 2005

Ultra-Large-Scale (ULS) Systems Study

Gather leading experts to study:

- characteristics of ULS systems
- challenges and breakthroughs required
- promising research and approaches

Intended outcomes:

- ULS System Research Agenda
- program proposal
- collaborative research network

About the Effort

Funded by the Army (ASA ALT)

*Staffing: 9 member SEI team
13 member expert panel*

Duration: one year (04/05 -- 05/06)

SEI Team

Linda Northrop

Software Design and Architecture,
Software Product Lines

Rick Kazman

Adaptive Architectures, Design Methods

Peter Feiler

Instead: A Different Kind of Study

It presents an overall research agenda -- not just for new tools or a new software method or modest improvements in today's approaches.

It is based on the challenges associated with ultra-large scale.

It focuses on the future.

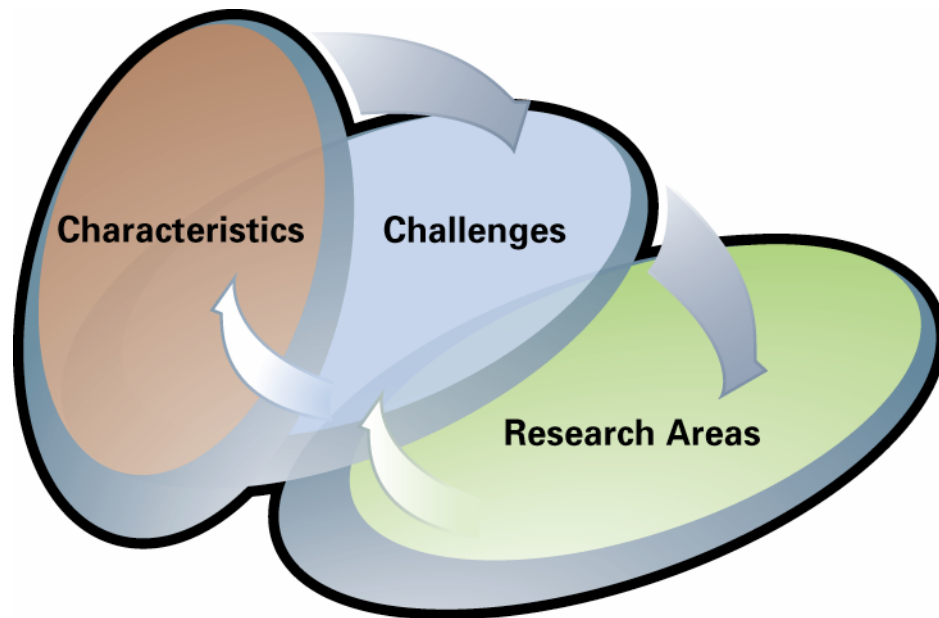

It involves an interdisciplinary base.

It takes a fresh perspective on the development, deployment, operation, and evolution of software-intensive systems.

Germes of these ideas are present today in small research pockets; these efforts are currently too small to have much impact on next-generation ULS systems.

ULS Systems Research Agenda

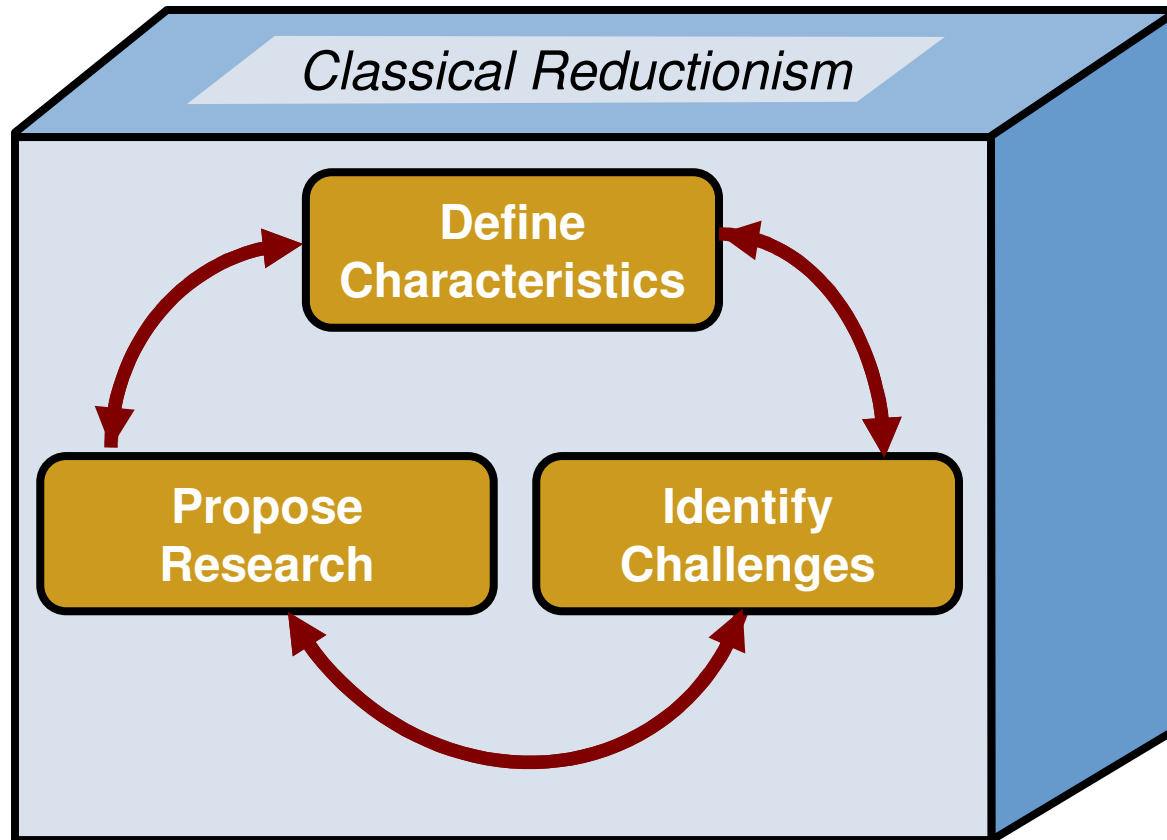

Describes

- the characteristics of ULS systems
- the associated challenges
- promising research areas and topics

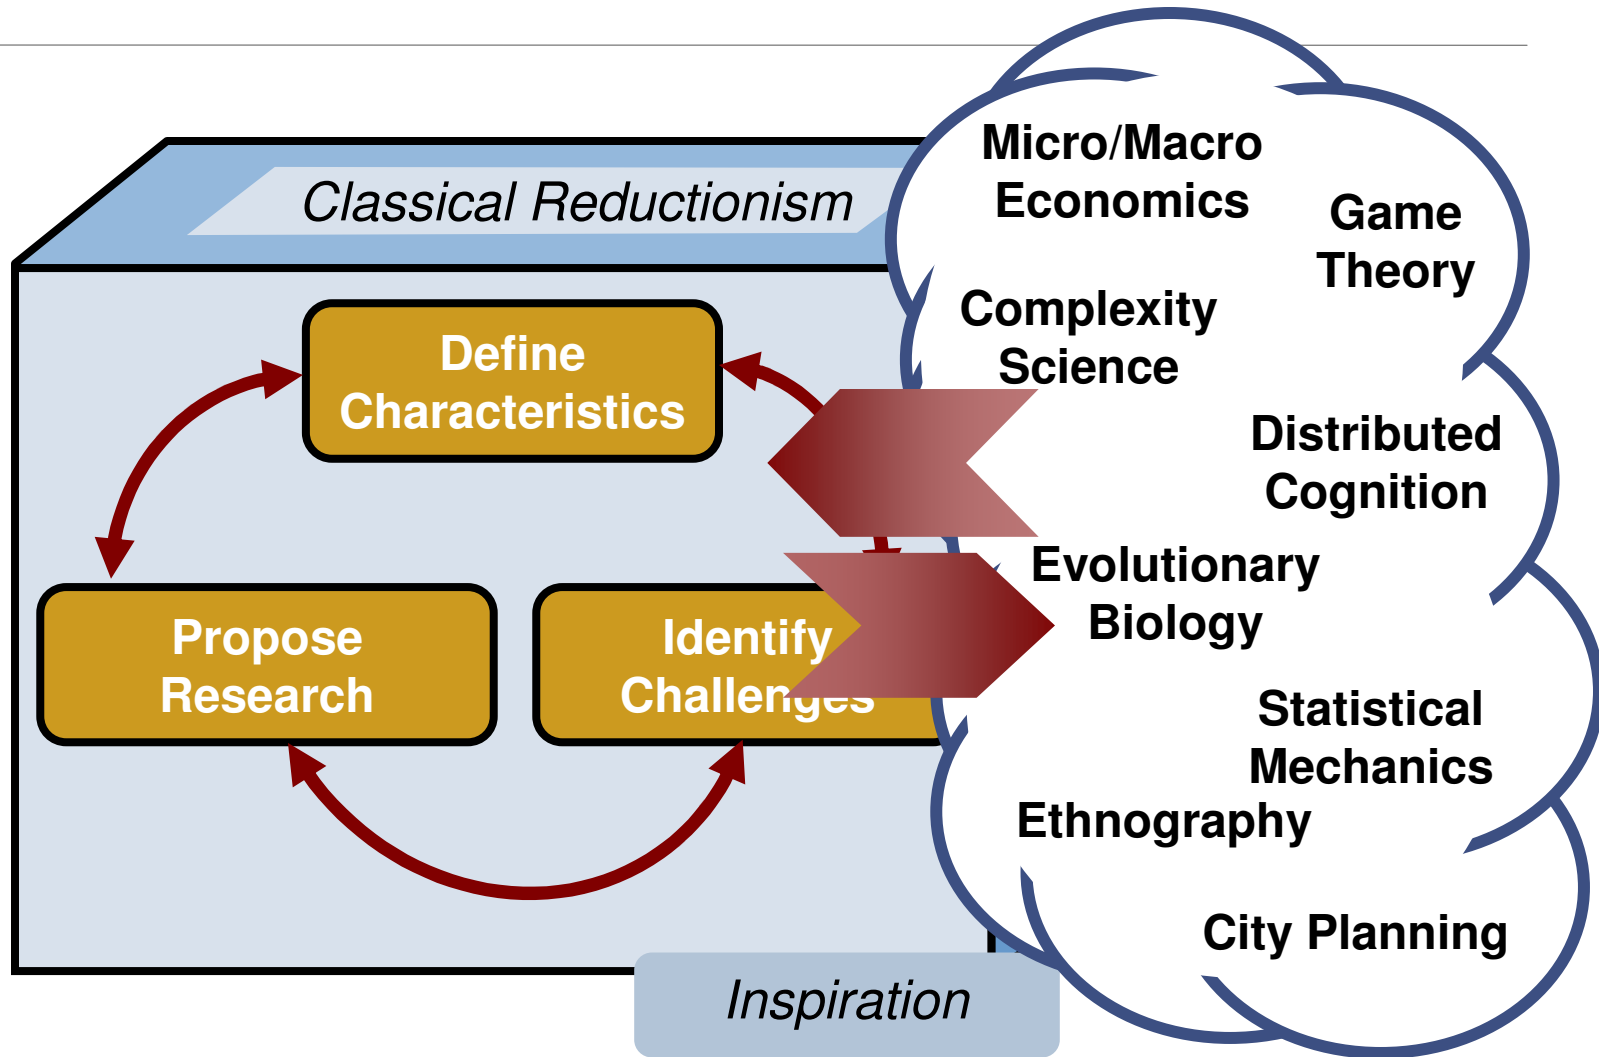

Is based on a new perspective needed to address the problems associated with ultra-large-scale systems.

Working Inside and Outside the Box

Working Inside and Outside the Box

The Journey

What Is an Ultra-Large-Scale (ULS) System?

A ULS System has unprecedented scale in some of these dimensions:

- Lines of code
- Amount of data stored, accessed, manipulated, and refined
- Number of connections and interdependencies
- Number of hardware elements
- Number of computational elements
- Number of system purposes and user perception of these purposes
- Number of routine processes, interactions, and “emergent behaviors”
- Number of (overlapping) policy domains and enforceable mechanisms
- Number of people involved in some way

ULS systems will be interdependent webs of software-intensive systems, people, policies, cultures, and economics.

ULS systems are systems of systems at internet scale.

Scale Changes Everything

Characteristics of ULS systems arise because of their scale.

- Decentralization
- Inherently conflicting, unknowable, and diverse requirements
- Continuous evolution and deployment
- Heterogeneous, inconsistent, and changing elements
- Erosion of the people/system boundary
- Normal failures
- New paradigms for acquisition and policy

These characteristics may appear in today's systems and systems of systems, but in ULS systems they dominate.

These characteristics undermine the assumptions that underlie today's software engineering approaches.

Today's Approaches

The Engineering Perspective - for large scale software-intensive systems

- largely top-down and plan-driven
- requirements/design/build cycle with standard well-defined processes
- centrally controlled implementation and deployment
- inherent validation and verification

The Agile Perspective - proven for smaller software projects

- fast cycle/frequent delivery/test driven
- simple designs embracing future change and refactoring
- small teams and retrospective to enable team learning
- tacit knowledge

Today's approaches are based on perspectives that fundamentally do not cope with the new characteristics arising from ultra-large scale.

The mentality of looking backward doesn't scale.

A New Perspective is Required

“The older is not always a reliable model for the newer, the smaller for the larger, or the simpler for the more complex...Making something greater than any existing thing necessarily involves going beyond experience.”

Henry Petroski

Pushing the Limits: New Adventures in Engineering

Today We Build “Buildings”

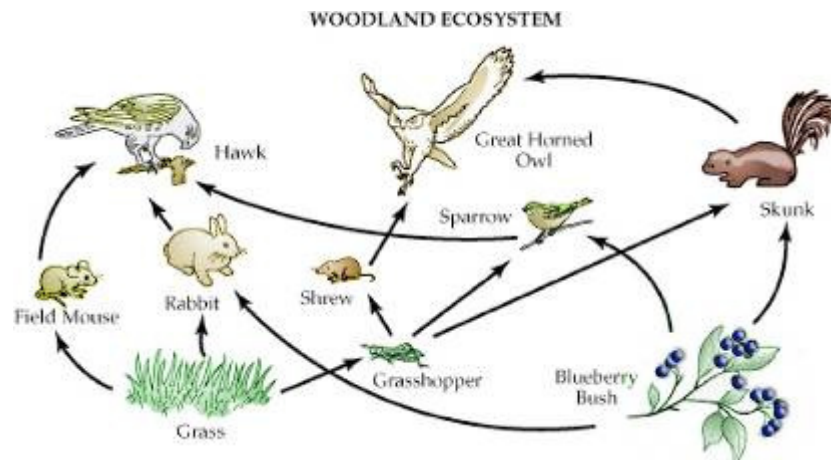

We Need To Think Cities

“Cities are places of massive information flows, networks, and conduits, and myriad transitory information exchanges.”
 Howard Rheingold: *Smart Mobs*

We Need to Think Ecosystem

Diverse users with complex networked dependencies and intrinsic adaptive behavior

Has:

- Robustness mechanisms: achieving stability in the presence of disruption
- Measures of health: diversity, population trends, other key indicators

We Need to Think Socio-Technical Ecosystems

Socio-technical ecosystems include people, organizations, and technologies at all levels with significant and often competing interdependencies.

- There will be competition for resources.
- There will be organizations and participants responsible for setting policies.
- There will be organizations and participants responsible for producing ULS systems.
- There will need to be local and global indicators of health that will trigger necessary changes in policies and in element and system behavior.

Why a New Perspective?

There are fundamental assumptions that underlie today's software engineering and software development approaches that are ***undermined*** by the characteristics of ULS systems.

There are challenges associated with ULS systems that today's perspectives are very unlikely to be able to address.

For the last forty years, engineering has been the dominant metaphor for software systems creation.

In ULS systems, we now are dealing with not just software but an ecosystem of people, organizations, governance, social interaction, hardware, and software.

Engineering is no longer the dominant metaphor.

ULS Systems vs Today's Approaches - 1

Characteristics	Today's assumptions undermined
Decentralized control	All conflicts must be resolved and resolved centrally and uniformly.
Inherently conflicting, unknowable, and diverse requirements	Requirements can be known in advance and change slowly. Tradeoff decisions will be stable.
Continuous evolution and deployment	System improvements are introduced at discrete intervals.
Heterogeneous, inconsistent, and changing elements	Effect of a change can be predicted sufficiently well. Configuration information is accurate and can be tightly controlled. Components and users are fairly homogeneous.

ULS Systems vs Today's Approaches - 2

Characteristics	Today's assumptions undermined
Erosion of the people/system boundary	People are just users of the system. Collective behavior of people is not of interest. Social interactions are not relevant.
Normal failures	Failures will occur infrequently. Defects can be removed.
New paradigms for acquisition and policy	A prime contractor is responsible for system development, operation, and evolution.

Challenges

ULS systems will present challenges in three broad areas:

- Design and evolution
- Orchestration and control
- Monitoring and assessment

Design and Evolution

Specific challenges in ULS system design and evolution stemming directly from the characteristics of ULS systems:

- Economics and industry structure
- Social activity for constructing computational environments
- Legal issues
- Enforcement mechanisms and processes
- Definition of common services supporting the ULS system
- Rules and regulations
- Agility
- Handling of change
- Integration
- User-controlled evolution
- Computer-supported evolution
- Adaptable structure
- Emergent quality

Orchestration and Control

Orchestration and control refers to the set of activities needed to make the elements of a ULS system work together in reasonable harmony to ensure continuous satisfaction of mission objectives.

Orchestration is needed at all levels of ULS systems and challenges us to create new ways for

- Online modification
- Maintenance of quality of service while providing necessary flexibility
- Creation and execution of policies and rules
- Adaptation to users and contexts
- Enabling of user-controlled orchestration

Monitoring and Assessment

The effectiveness of ULS system design, operation, evolution, orchestration, and control has to be evaluated.

There must be an ability to monitor and assess ULS system state, behavior, and overall health and well being.

Challenges include

- Defining indicators
- Understanding why indicators change
- Prioritizing the indicators
- Handling change and imperfect information
- Gauging the human elements

Where Do We Focus Our Research

- Address the predominant characteristics of ULS systems and the three challenge categories.
- Look for breakthroughs not incremental improvement in current approaches.
- Take a more expansive view of software research and include its interactions with associated research in the physical and social sciences.

Inspiration: Open Source and Cooperative Communities

Inspiration: Game Theory

A GAME THEORY 1	A GAME THEORY 2	A GAME THEORY 3	A GAME THEORY 4
			
Oskar Morgenstern 1902 – 1977	John von Neumann 1903 – 1957	John F. Nash Jr. b1928	Reinhard Selten b1930

Algorithmic Mechanism Design

- games + microeconomics + computation
- computational markets for any scarce ULS resource?

Institution Design

- learning games + self-reinforced expectations + cultural norms
- better formal models of acquisition in non-prime-dominated landscape?

Inspiration: Networks, Statistical Mechanics, Complexity

HIV Partners

Stability

Networks Are Everywhere

Recurring “scale free” structure

- internet & yeast protein structures

Analogous dynamics?

- epidemiology, robustness and vulnerability

Unstable Equilibrium

How many changes before a system becomes unstable?

What scale and frequency of disruptions can be expected?

Economics (Finance) As Design Criteria

- Design rules (feature parameterization)
- Module maximizes option value
- ROI inversely proportional to module footprint
- Each module a potential point for competition
- (apologies for abuse of ideas to Carliss Baldwin)

Research Portfolio

We recommend an interdisciplinary portfolio of seven research areas and suggested topics for breakthrough research needed to meet the challenges associated with ULS systems.

- Is not expressed in terms of today's "hot" technologies.
- Does not supplant current software research.
- Expands today's horizons.

Research Areas - 1

6.1 Human Interaction: Involves anthropologists, sociologists, and social scientists conducting detailed socio-technical analyses of user interactions in the field, with the goal of understanding how to construct and evolve such socio-technical systems effectively.

- Context-Aware Assistive Computing
- Understanding Users and Their Contexts
- Modeling Users and User Communities
- Fostering Non-Competitive Social Collaboration
- Longevity

Research Areas - 2

6.2 Computational Emergence:

Explores the use of methods and tools based on economics and *game theory* (e.g., *mechanism design*) to ensure globally optimal ULS system behavior by exploiting the strategic self interests of the system's constituencies; explores *metaheuristics* and *digital evolution* to augment the cognitive limits of human designers.

- Algorithmic Mechanism Design
- Metaheuristics in Software Engineering
- Digital Evolution

A GAME THEORY 1	A GAME THEORY 2	A GAME THEORY 3	A GAME THEORY 4
 Oskar Morgenstern 1902 – 1977	 John von Neumann 1903 – 1957	 John F. Nash Jr. 1928	 Reinhard Selten 1928

Innovation/Invention Index -34.0	Innovation/Invention Index -42.0	Innovation/Invention Index +10.2	Innovation/Invention Index +17.4
Expected Utility 1.5	Expected Utility 1.0	Expected Utility 0.0	Expected Utility 2.0

Research Areas - 3

6.3 Design: Broadens the traditional technology-centric definition of design to include people and organizations; social, cognitive, and economic considerations; and design structures such as *design rules* and government policies.

- Design of All Levels
- Design Spaces and Design Rules
- Harnessing Economics to Promote Good Design
- Design Representation and Analysis
- Assimilation
- Determining and Managing Requirements

Research Areas - 4

6.4 Computational Engineering: Focuses on evolving the expressiveness of representations to accommodate the semantic diversity of many languages and focuses on providing automated support for computing the evolving behavior of components and their compositions.

- Expressive Representation Languages
- Scaled-Up Specification, Verification, and Certification
- Computational Engineering for Analysis and Design

Research Areas - 5

6.5 Adaptive System Infrastructure: Investigates integrated development environments and runtime platforms that will support the decentralized, “always-on,” nature of ULS systems as well as technologies, methods, and theories that will enable ULS systems to be developed in their deployment environments.

- Decentralized Production Management
- View-Based Evolution
- Evolutionary Configuration and Deployment
- In Situ Control and Adaptation

Research Areas - 6

6.6 Adaptable and Predictable System Quality: Focuses on how to maintain quality in a ULS system in the face of continuous change, ongoing failures, and attacks and how to identify, predict, and control new indicators of *system health* (akin to the U.S. gross domestic product) that are needed because of the scale of ULS systems.

- Robustness, Adaptation, and Quality Attributes
- Scale and Composition of Quality Attributes
- Understanding People-Centric Quality Attributes
- Enforcing Quality Requirements
- Security, Trust, and Resiliency
- Engineering Management at Ultra-Large Scales

Research Areas - 7

6.7 Policy, Acquisition, and Management: Focuses on transforming acquisition policies and processes to accommodate the rapid and continuous evolution of ULS systems by treating suppliers and supply chains as intrinsic and essential components of a ULS system.

- Policy Definition for ULS Systems
- Fast Acquisition for ULS Systems
- Management of ULS Systems

Research Areas and Challenges

Toward a Roadmap for a ULS Systems Research Program

There are many possible approaches to structuring a research program from the ULS Systems Research Agenda

We provide three possible support structures based on

1. Specific DoD missions and capabilities
2. DoD research funding types required
3. Estimates of the relative starting points of the research

Sponsors with different needs can choose to support different combinations of research.

Table 4: Research Areas and Range of Risk/Reward

Research Areas and Topics	Existing Groundwork	Breaking Ground	New Direction
Human Interaction			
6.1.1 Context-Aware Assistive Computing	●		
6.1.2 Understanding Users and Their Contexts	●	●	
6.1.3 Modeling Users and User Communities		●	●
6.1.4 Fostering Non-Competitive Social Collaboration		●	●
6.1.5 Longevity	●	●	●
Computational Emergence			
6.2.1 Algorithmic Mechanism Design	●	●	●
6.2.2 Metaheuristics in Software Engineering	●	●	
6.2.3 Digital Evolution	●	●

6.4.1 Expressive Representation Languages	●	●	●
6.4.2 Scaled-Up Specification, Verification, and Certification	●	●	
6.4.3 Computational Engineering for Analysis and Design	●	●	●

The envisioned outcome of the proposed research is a spectrum of technologies and methods for developing ULS systems, with national-security, economic, and societal benefits that far extend beyond ULS systems themselves.

Study Conclusions

There are fundamental gaps in our current understanding of software development at the scale of ULS systems.

These gaps

- present profound impediments to the technically and economically effective achievement of the DoD goals* based on information superiority and to effective solutions for many of society's vexing problems
- require a broad, fresh perspective and interdisciplinary, breakthrough research

We recommend

- a ULS Systems Research Agenda that includes research areas based on a fresh perspective aimed at challenges arising from increasing scale

** As stated in the Quadrennial Defense Review (QDR) Report, Feb 2006*

ULS Systems Research Study Report

Acknowledgements

Executive Summary

Part I

1. Introduction
2. Characteristics of ULS Systems
3. Challenges
4. Overview of Research Areas
5. Summary and Recommendations

Part 2

- 6 Detailed Description of Research Areas
- Glossary

<http://www.sei.cmu.edu/uls/>

The Start of a Collaborative Research Network

Workshops

Keynotes

Panels

Emerging
Research
Efforts

Activity Since Report Published in May 06

There is growing community interest and research starts.

Since July 06

- more than 95,000 downloads of the report
- more than 3,000 copies of the report distributed
- more than 14 keynotes and more than 25 presentations by author team
- three press and one industry analyst interviews
- research workshops at OOPSLA 2006 and ICSE 2007
- NSF center established

New SEI Research Activities

- Mechanism design
- Implications of ULS on software architecture

Roadmap Exercise funded by Army organization (CERDEC)

New book from a non-military perspective is underway.

SMART Event

Upcoming event:

- ICSE 2008 Workshop

<http://www.sei.cmu.edu/uls>

Redesign of SEI ULS Systems Website

New site features include

- Podcasts and video presentations
- ULS Systems news & events
 - RSS feed
- ULS Systems library
- Online Glossary

<http://www-sei.cmu.edu/uls/>

What We Learned That We Want to Share

- There is an unstoppable trend toward increasing scale in many systems important to our society.
- Scale changes everything.
- Manifestations of scale and its attendant complexity arise in many disciplines, and can be understood as a phenomenon in its own right.
- New, interdisciplinary perspective and new research in building ultra-large-scale systems is long overdue.

thank you
