Problems and Challenges

DoD Weapon Systems Acquisition Continues To Be High Risk Area

While DOD's acquisition process has produced the best weapons in the world, it also yields undesirable consequences in weapon system programs – cost increases, schedule delays, and performance shortfalls

Problems occur because weapon programs do not capture early on the requisite knowledge that is needed to effectively manage risks

Programs move forward with unrealistic cost and schedules estimates, lack clearly defined and stable requirements, use immature technologies, and fail to solidify design and manufacturing processes at appropriate junctures in development

As a result, programs require more resources than planned, the buying power of the defense dollar is reduced, and funds are not available for other competing needs

Paul Francis, Director Acquisition and Sourcing Management U.S. Government Accountability Office May 18, 2004

Problem Statement

A statement of organizational process maturity or capability level does not guarantee performance to that same level of proficiency on an individual project

Most DoD contractors claim high maturity/capability levels, yet from the perspective of the acquirer, systems engineering and program management practices are severely lacking

Teaming arrangements further cloud the issue of process execution and proficiency

Associated problems may not be evident until significant cost, schedule, or performance objectives have been missed at a late point in the program where corrective actions are very costly

How can the acquirer gain the necessary insight into process execution and proficiency as well as reinforce desired behaviors?

Development Challenges

Huge system/software engineering endeavors in aircraft, space vehicles, ground systems, C2, C4ISR, battle mgt, etc

Significant risks for acquisition programs

- Multi-million SLOC programs; "hybrid" systems combining legacy re-use, COTS, new development
- Multi-contractor teams using different processes;
 Dispersed engineering & development locations
- New technologies create opportunities/challenges; products change/evolve
- Business/operational needs change often faster than full system capability can be implemented
- Contractor and Acquirer skills shortfalls; Cost and schedule constraints

Acquirers' Concerns

Appraisals are conducted just for the "ratings"

Appraisal team/lead objectivity and expertise is questionable, especially with high maturity appraisals

Appraisals are conducted on dissimilar projects and/or in unrelated organizations/sites

The effect of teaming arrangements on project process performance is not accounted for

There is a lack of insight into contractor process execution on specific projects

The effect of process immaturity in acquiring organizations

High Maturity Organizations

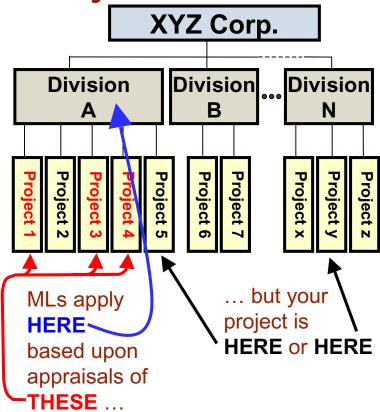

Maturity Levels are indicators of organizational potential performance.

They describe how the next project may *perform* based on a sampling of existing projects.

Maturity Levels reside at the organizational level and are not an indication of how an individual project is performing.

High Maturity Projects

Acquirer Needs

A means to assess developer process execution on their project

- Process performance
- Process capability
- Process adherence

A means to assess project process execution across large, distanced, and diverse teams

A means to assess <u>all</u> technical and project management process areas

- Engineering
- Project Management
- Financial Management
- Support Processes

A means to assess project risks driven by developer process execution

A means to assess the potential process execution risks in source selection

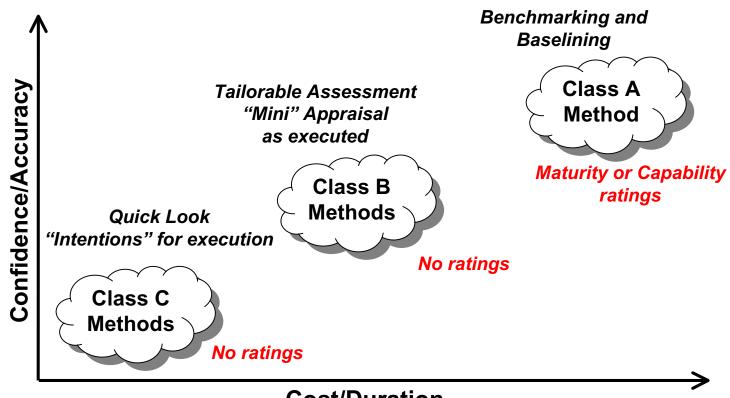

Assessment Alternatives

Standard CMMI Appraisal Method for Process Improvement (SCAMPI)

Cost/Duration

Assessment Alternatives Mapped to Acquirer Needs

SCAMPI Method A

Institutionalization Organizational focus Rigorous, expensive Ratings

Resource Intensive Limited utility for source selection

Contract Monitoring
Competitive Downselect

SCAMPI Method B

Deployment and execution Evidence of implementation What they are doing

Contract Monitoring
Source Selection

SCAMPI Method C

Approach
Plan for execution
What they will do

Process In-Execution Reviews

PIER Ground Rules

Use the process model – CMMI

Interview questions based on model

Appraisal of process performance and adherence

Focus on risk assessment – risks associated with process performance, adherence, and capability

Observe strict confidentiality

Results not attributable to individuals or interview groups

Approach SCAMPI collaboratively

Results in actionable findings by Program Office and/or Contractor

What a PIER Is and Is Not

Is an appraisal (SCAMPI-B) of the execution of and the risks associated with process implementation of the entire project team, including sub-contractors

Is a mechanism to provide insight into the operations of a specific program with respect to the organization's published maturity level

Is not a formal appraisal (SCAMPI-A)

No rating

No multiple projects within the organization; focus on specific project

No coverage of entire life cycle; focus on phase or nearterm milestones

Phase 1: Plan and Prepare for the Appraisal

Appraisal Team/Lead

- Lead assists Sponsor in matching appraisal w/business objectives
- Lead and sponsor agree on details of appraisal plan
- Lead prepares team members
- Prepares in-briefs for contractor
- Lead performs readiness review

SEI/MITRE/ESC

- Templates and guidance on plan preparation & PIER execution
- Assist PMO
- Model scope guidance
- Role definition guidance for customer & contractor
- Security procedures

Contractor

- Coordinates with the PMO
- Identify site coordinator, process lead, and non-voting team member (as appropriate)
- Schedule facilities & resources to support the plan
- Collect relevant objective evidence
- Prepare project to support PIER (schedule interviews, briefings, demos)

- Establishes contractual arrangement
- Sponsors appraisal
- Establishes business goals
- Coordinates with Contractor
- Coordinates & approves appraisal plan

Phase 2: Conduct Appraisal

Appraisal Team/Lead

- Examines objective evidence
- Verifies the implementation of the organization's practices
- Validates findings
- Generate appraisal results
- Lead collects lessons learned
- Data & artifacts are appropriately archived or destroyed

SEI/MITRE/ESC

- Evidence collection tool
- Findings briefing template and guidance
- On-site scheduling guidance
- Guidance for preparation and delivery of preliminary findings
- Further definition of customer & contractor roles

Contractor

- Provide Project context briefing
- Ensure contractor responsibilities are met to support PIER (briefings, interviewees, demos)
- Support additional evidence requests in a timely manner
- Provide PIER team facilities in accordance with plan requirements

- Coordinate as necessary with Team Lead & Contractor
- Resolve any appraisal execution issues

Phase 3: Report Results

Appraisal Team/Lead

- Delivers final findings to customer & to contractor
- Reports results to PIER steward as authorized by PMO

SEI/MITRE/ESC

- Findings template
- Final findings delivery guidance
- Disclosure statement guidance
- ESC PIER Custodian who retains information as observations & trends without project or Contractor attribution

Contractor

- Attend outbrief
- Analyze results & incorporate into next cycle of process improvements

- Attends outbrief
- Owns final findings & authorizes release of information to ESC PIER Custodian
- Analyzes results & integrates into project data for future use in award fee, program reviews, improvement initiatives, etc.

Example

Integrated Supplier Management

Description:

The purpose of Integrated Supplier Management is roactively identify sources of products that may be used as is the project's requirements and to manage the cut is suppliers while maintaining a cooperative project-supplier relationship.

Strengths:

• Proactive engage with suppliers on early Time and Materials succentages expedited the creation of supplier recrire and solves for the program.

eaknesses:

- The lack of monitoring of supplier processes may cause execution of supplier agreements to be compromised. (SG 2)
- The Subcontract Management Plan is still in draft form. (GG 2)

Example

Integrated Supplier Management

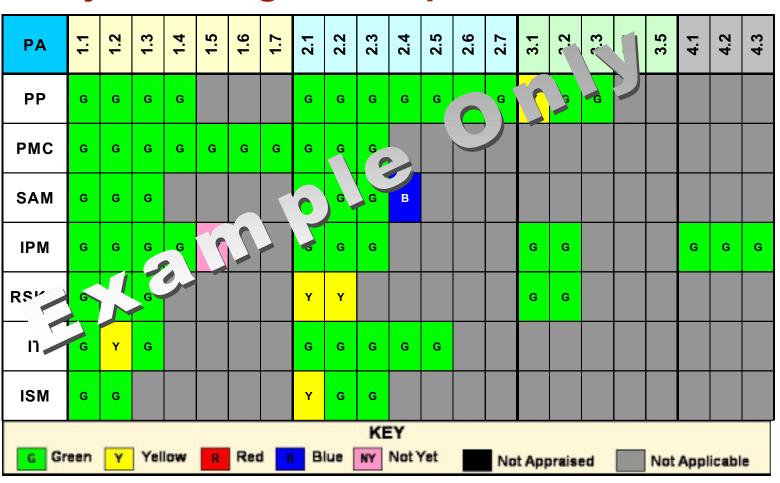

Notes:

• Issues with critical subcontractors exist and continue of be worked

Example

Project Management Specific Practices

PIER Commitment

Appraisal Team/Lead

- Ensure team composition is highcaliber
- Everyone shares work load based on team expectations
- Collect lessons learned to improve the PIER (SCAMPI-B) process

SEI/MITRE/ESC

- Support and refine PIER (SCAMPI-B) method
- ESC PIER Custodian
- Work with PMO to ensure appropriate interpretation & use of findings
- Ensure confidentiality of results
- Provide updated templates and materials

Contractor

- Participation
- Evidence prepared with adequate time to review prior to on-site
- Resolution of access to information issues in advance of on-site
- Relevant personnel provided for interviews
- Act on findings

- Contractual obligation
- Resources
- Act on findings

PIER Lessons Learned

Appraisal Team/Lead

- Have consistent approach among team leads across program PIERs
- Train team on appraisal tools and templates prior to the appraisal
- Complete document review prior to start of the on-site
- Site coordinator needs to know the CMMI model
- Team building activities critical

Contractor

- Provides feedback on process implementation
- Non-trivial amount of effort to support the PIER activity
- Demonstration of organization's commitment to CMMI

SEI/MITRE/ESC

- Need guidance and templates to ensure consistency of PIERs
- Capture observations and trends to isolate potential systemic problems
- Plan PIERs to avoid impacting peak or critical activities
- Contractor non-voting team member proved very valuable
- Credibility counts!

- Provides confidence in contractor through insight
- Process proficiency and execution varies substantially
- Basis for assessing contractor responsiveness
- PMOs must work internal processes to complement Contractor

ESC Case Studies

ESC Case Studies

Joint Environmental Tool Kit (JET)

- Contract monitoring
- Risk identification
- Competitive downselect

KG-3X Crypto Modernization Program

- Contract monitoring
- Risk identification
- Competitive downselect

Joint Mission Planning System (JMPS)

- Contract monitoring
- Risk identification

Summary

Next Steps for PIER

Expand the scope of PIERs

Financial Management

Assess execution of Earned Value Management System (EVMS) practices especially in correlating product maturity and performance to earned value – Technical Performance Measures (TPMs)

Product Quality

Product quality in terms of technical maturity and product performance using models, simulations, prototypes, and early functional assessments

May integrate with the Integrated Baseline Review (IBR) process

Summary

SCAMPI-A appraisals and advertised CMMI ratings do not guarantee that individual projects will perform to those levels of proficiency

PIERs have validated the SCAMPI-B Method in a contract monitoring context

PIERS provide insight into project process execution, both for Program Office and for Contractor

PIERS demonstrate program office commitment to process

PIERs can be complementary components to other reviews and technical interchanges

PIERs can be used to support award fee evaluations
