Problem Statement and Focus

Writing secure C++ code is hard, existing coding standards are insufficient

MISRA C++:2008 and JSF++ (2005) focus on safety-critical systems; outdated

- CERT rules focus on modern concerns: C++11 and C++14.
 - Concurrency, lambdas, and other modern, high-impact C++ features

C++ Core Guidelines (2015) are modern, but subset the language; e.g.,

- ES.75: Avoid `do` statements
- I.11: Never transfer ownership by a raw pointer (\mathbb{T}^*)
- CERT rules do not subset the C++ language
 - Encourages adoption within legacy code bases as well as new

Enforceability of the rules is desirable.

- Demonstrate implementing checkers to help strengthen and enforce rules

Do not replicate rules from the CERT C Coding Standard

Our Results: Checkers

Contributed 15 new checkers to the Clang open source compiler (the C/C++ frontend to the LLVM compiler infrastructure)

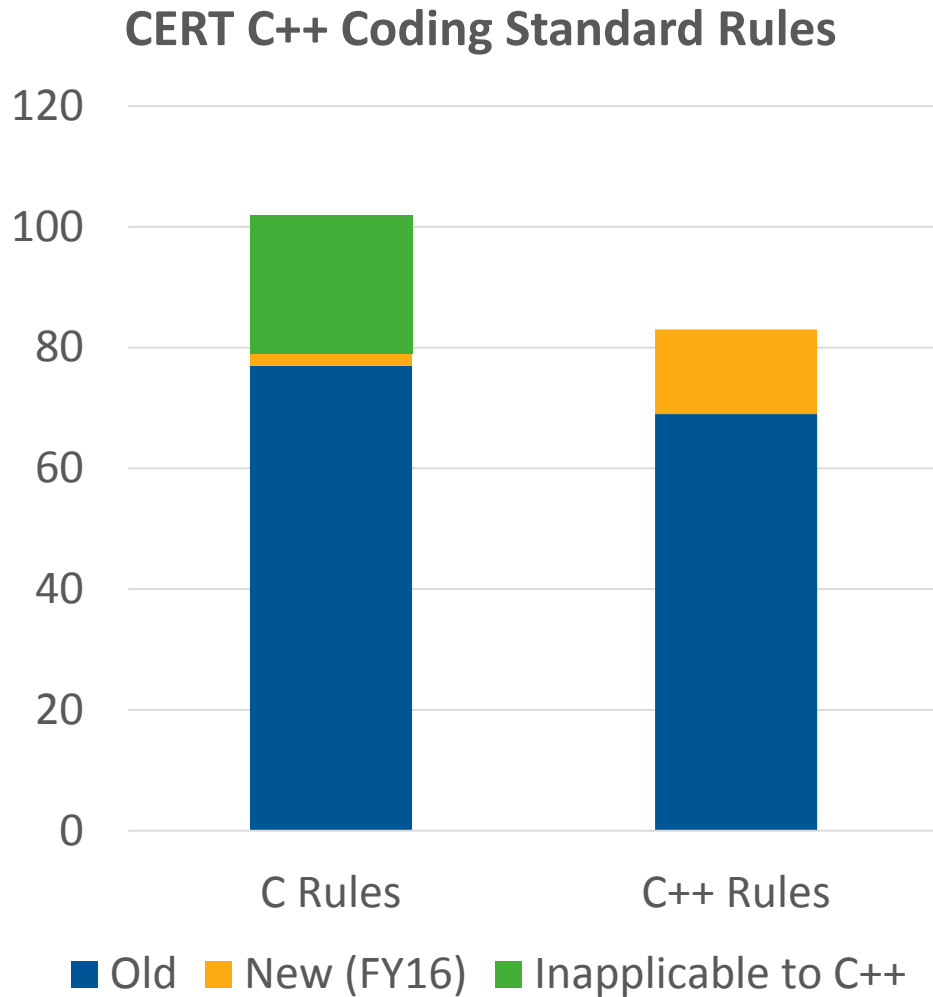

Clang community has shown significant interest in CERT's contributions

- Community members are making their own contributions based on our rules
- Demonstrated a desire to make it easier to enable all checks for CERT rules

Clang is used by 10s of millions of programmers to write 100s of millions of apps that are used by billions of users

- Primary compiler for MacOS, iOS, FreeBSD
- Supported by Microsoft Visual Studio, Linux

Our Results: Rules

1. Declarations and Initialization (DCL)
2. Expressions (EXP)
3. Integers (INT)
4. Containers (CTR)
5. Characters and Strings (STR)
6. Memory Management (MEM)
7. Input Output (FIO)
8. Exceptions and Error Handling (ERR)
9. Object Oriented Programming (OOP)
10. Concurrency (CON)
11. Miscellaneous (MSC)

All rules were heavily modified

Our Results: Rule Organization

A screenshot of a web page for a rule titled "DCL22-CPP. Functions declared with [[noreturn]] must return void". The page includes a breadcrumb trail, navigation icons (Edit, Watch, Share), and a paragraph of text. Two blue callout boxes with white text are overlaid on the image: one pointing to the title and another pointing to the main text paragraph.

DCL22-CPP. Functions declared with `[[noreturn]]` must return void

Created by Aaron Ballman, last modified on Aug 24, 2016

As described in [MSC55-CPP](#). Do not return from a function declared `[[noreturn]]`, functions declared with the `[[noreturn]]` attribute must not return on any code path. If a function declared with the `[[noreturn]]` attribute has a non-void return value, it implies that the function returns a value to the caller even though it would result in [undefined behavior](#). Therefore, functions declared with `[[noreturn]]` must also be declared as returning void.

Title

Introduction &
Normative Text

Noncompliant Code Example

In this noncompliant code example, the function declared with `[[noreturn]]` claims to return an `int`:

```
#include <cstdlib>

[[noreturn]] int f() {
    std::exit(0);
    return 0;
}
```

Noncompliant Code
Don't try this at home!

This example does not violate [MSC55-CPP. Do not return from a function declared `\[\[noreturn\]\]`](#) because `std::exit()` is declared `[[noreturn]]`, so the `return 0;` statement can never be executed.

Compliant Solution

Because the function is declared `[[noreturn]]`, and no code paths in the function allow for a return in order to comply with [MSC55-CPP. Do not return from a function declared `\[\[noreturn\]\]`](#), the compliant solution declares the function as returning `void` and elides the explicit return statement:

```
#include <cstdlib>

[[noreturn]] void f() {
    std::exit(0);
}
```

Compliant Code
Fixes noncompliant code.

Risk Assessment

A function declared with a non-void return type and declared with the `[[noreturn]]` attribute is confusing to consumers of the function because the two declarations are conflicting. In turn, it can result in misuse of the API by the consumer or can indicate an implementation bug by the producer.

Rule	Severity	Likelihood	Remediation Cost	Priority	Level
DCL22-CPP	Low	Unlikely	Low	P3	L3

Automated Detection

Tool	Version	Checker	Description
Clang	3.9	-Winvalid-noreturn	

Related Vulnerabilities

Search for [vulnerabilities](#) resulting from the violation of this rule on the [CERT website](#).

ERR52-CPP. Do not use setjmp() or longjmp()

Created by Fred Long, last modified by Sandy Shrum about 3 hours ago

The C standard library facilities `setjmp()` and `longjmp()` can be used to simulate throwing and catching exceptions. However, these facilities bypass automatic resource management and can result in **undefined behavior**, commonly including resource leaks, and **denial-of-service attacks**.

```
E:\llvm\2015>clang-tidy -checks=-*,cert-* E:\Desktop\test1.cpp -- -std=c++14
2 warnings generated.
E:\Desktop\test1.cpp:7:7: warning: do not call 'setjmp'; consider using exception
handling instead [cert-err52-cpp]
  if (setjmp(env) == 0) {
      ^
```

THE END
