Temporal Partitioning in Distributed CPS

Critical to Verify Timing of CPS

• Late interaction with physical world can be catastrophic

Complexity of CPS Requires Modularization

- Large CPS integrated from components from different organizations
- Prevent modification of component from affecting all system

Everything is Distributed

• Any medium-size CPS runs on a network of computers

Mixed-Criticality

FAA / CO-178C

- Criticality \equiv Failure Condition Categories
 - Catastrophic
 - Hazardous
 - Major
 - Minor
 - No Safety Effects
- Higher The Failure Consequence Higher Level of Correctness Certainty
- Low-criticality allowed lower correctness certainty iff prevented from interfering with high-criticality

Scheduling (S. Vestal)

- Higher Estimate of Worst-Case Execution Time => Higher Confidence of Correctness
- Protect Higher-Criticality Tasks from Lower-Criticality Ones
 - ASYMMETRIC PROTECTION!

Consolidation of Mixed-Criticality Tasks

Consolidation of Mixed-Criticality Tasks

Software Engineering Institute Carnegie Mellon University

Temporal Partitioning and Verification in Distributed CPS March 20–23, 2017 © 2017 Carnegie Mellon University

Rate-Monotonic Priority

Shorter Period \rightarrow Higher Priority

- Ideal utilization
- BUT: Poor Criticality Protection Due to Criticality Inversion
 - If criticality order is opposite to rate-monotonic priority order

Temporal Partitioning and Verification in Distributed CPS March 20–23, 2017 © 2017 Carnegie Mellon University

Criticality As Priority Assignment (CAPA)

Higher Criticality → Higher Priority

- Ideal criticality protection:
 - lower criticality cannot interfere with higher criticality
- BUT: Poor Utilization Due to Priority Inversion
 - If criticality order is opposite to rate-monotonic priority order

Temporal Partitioning and Verification in Distributed CPS March 20–23, 2017 © 2017 Carnegie Mellon University [DISTRIBUTION STATEMENT A] This material has been approved for public release and unlimited distribution. Please see Copyright notice for non-US Government use and distribution.

Zero-Slack Scheduling

Tasks with:

• Period (T), Normal (C), and Overloaded (C^o) Execution Times

Start with rate-monotonic scheduling

Calculate the last instant before τ_{HC} misses its deadline

• this is called the zero-slack instant

Switch to criticality-as-priority

- Splits the execution window into
 - Normal mode (RM)
 - Critical mode (CAPA)

D. de Niz, K. Lakshmanan, and R. Rajkumar. On the Scheduling of Mixed-Criticality Real-Time Tasksets. RTSS 09.

Zero-Slack Scheduling

Tasks with:

• Period (T), Normal (C), and Overloaded (C^o) Execution Times

Start with rate-monotonic scheduling

Calculate the last instant before τ_{HC} misses its deadline

• this is called the *zero-slack* instant

Switch to criticality-as-priority

- Splits the execution window into
 - Normal mode (RM)
 - Critical mode (CAPA)

D. de Niz, K. Lakshmanan, and R. Rajkumar. On the Scheduling of Mixed-Criticality Real-Time Tasksets. RTSS 09.

ZSRM Properties

Subsumes RM

- If criticalities are aligned to priorities
- No critical mode

Subsumes CAPA

• If not enough slack, only critical mode

Graceful Degradation

• In overloads, deadlines are missed in reverse criticality order

Implementation

ZSRM

Scheduling algorithm calculates zero-slack instants offline

Linux/ RK

- Resource reservation in Linux
 - CPU, Net, Mem, Disk
- Bundled into resource sets that provide a form of virtual machine
- Multiple implementations
 - Nano/RK for sensor networks
- Special Zero-Slack Reserves
 - Switch to critical mode
 - Stop lower-criticality tasks on zero-slack instant
 - Tasks in critical mode in stack

Library prototype implementation for VxWorks

What if criticality exhibits diminishing returns?

Task	Period	Criticality	WCET	NCET
t ₁ Surveillance Cov.	4	Mission	2	2
t ₂ Collision Avoid.	8	Safety	5	2.5

Future Challenges

Increasingly Complex Hardware

- Massive multicores: Tile processors
- Heterogeneous multicores: hardware accelerators
- Adaptive Power: Dynamic Thermal Management

Increasingly Complex Software

- Machine Learning
 - Learning while executing could lead to unpredictable WCET
 - How to bound unpredictable behavior On Time (before crash)
- Complex distributed systems
 - Coordinated autonomy: smart highways
 - Global Internet of Things

Increasing Development Complexity

- Components from Different Suppliers
- Potential Safety Enforcement from Safety/Certification Authorities
