Challenges in Existing System Safety Practices

Current Reliance on Engineering Process

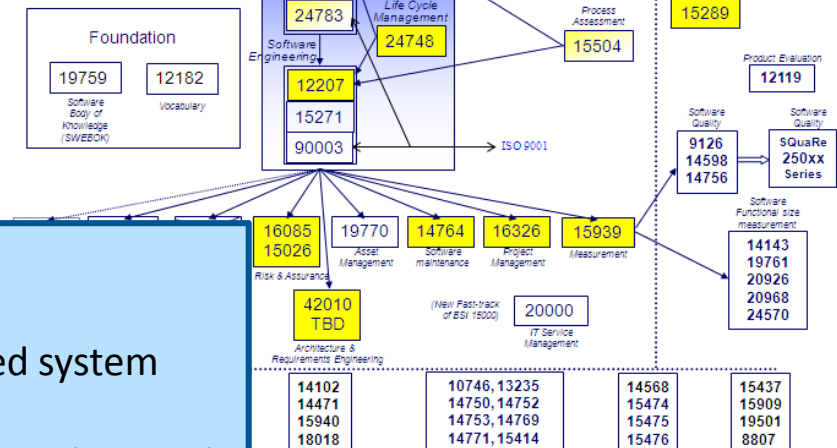

Guidelines for Robust & Reliable Aircraft

- DO-178B-Software Considerations in Airborne Systems and Equipment Certification
- DO-248B-Final Report for the Clarification of DO-178B
- DO-278-Guidelines for Communications, Navigation, Surveillance, and Air Traffic Management
- DO-254-Design Assurance Guidance for Airborne Electronic Hardware
- DO-297-Integrated Modular Avionics (IMA) Development Guidance and Certification Considerations
- SAE-ARP4754-Certification Consideration for Highly Integrated or Complex Aircraft Systems
- SAE-ARP4671- Guidelines for the Development of Software for Airborne Systems and Equipment
- FAA Advisory Circular AC 120-66-Software Development Processes for Airborne Systems and Equipment
- FAA Advisory Circular AC 120-67-Software Development Processes for Airborne Systems and Equipment
- ISO/IEC 12207-Software Life Cycle Processes
- ARINC 653-Specification for Airborne Systems and Equipment
- MIL-STD-882D-DoD System Safety Handbook
- ADS-51-HDBK-Rotorcraft and Aircraft Qualification Handbook
- AR-70-62-Airworthiness Release Standard
- ADS-75-SS-Army Aviation System Safety Assessments and Analyses
- ADS-48-PRF-Performance Specification for Airworthiness Qualification Requirements for Instrument Flight Rules
- ADS-64-SP-Airworthiness Requirements for Military Rotorcraft
- SED-SES-PMHFA001-Software Engineering Directorate (SED) Software Engineering Evolution of Airworthiness
- SED-SES-PMHSS001 SED SEES Program Manager Handbook for Software Safety

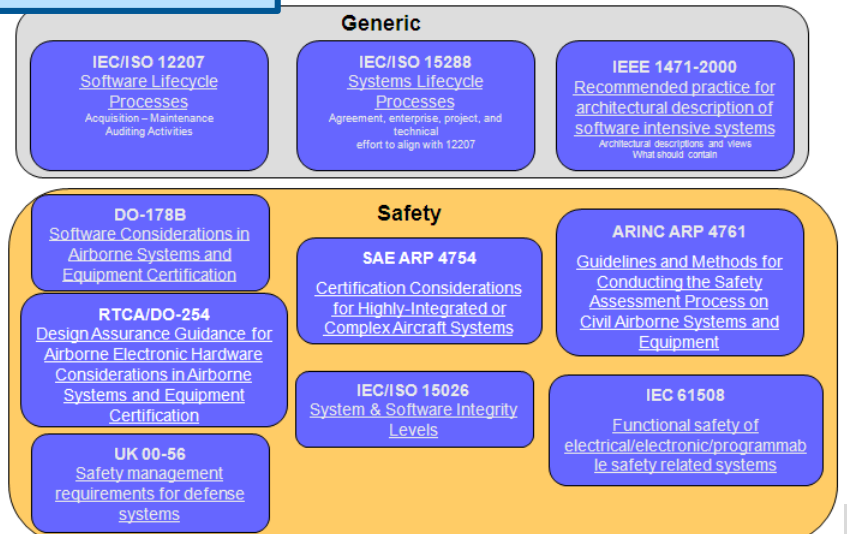

Current methods explicitly depend on

- standards and regulations
- rigorous examination of whole finished system
- conservative practices and safety culture (Rushby)

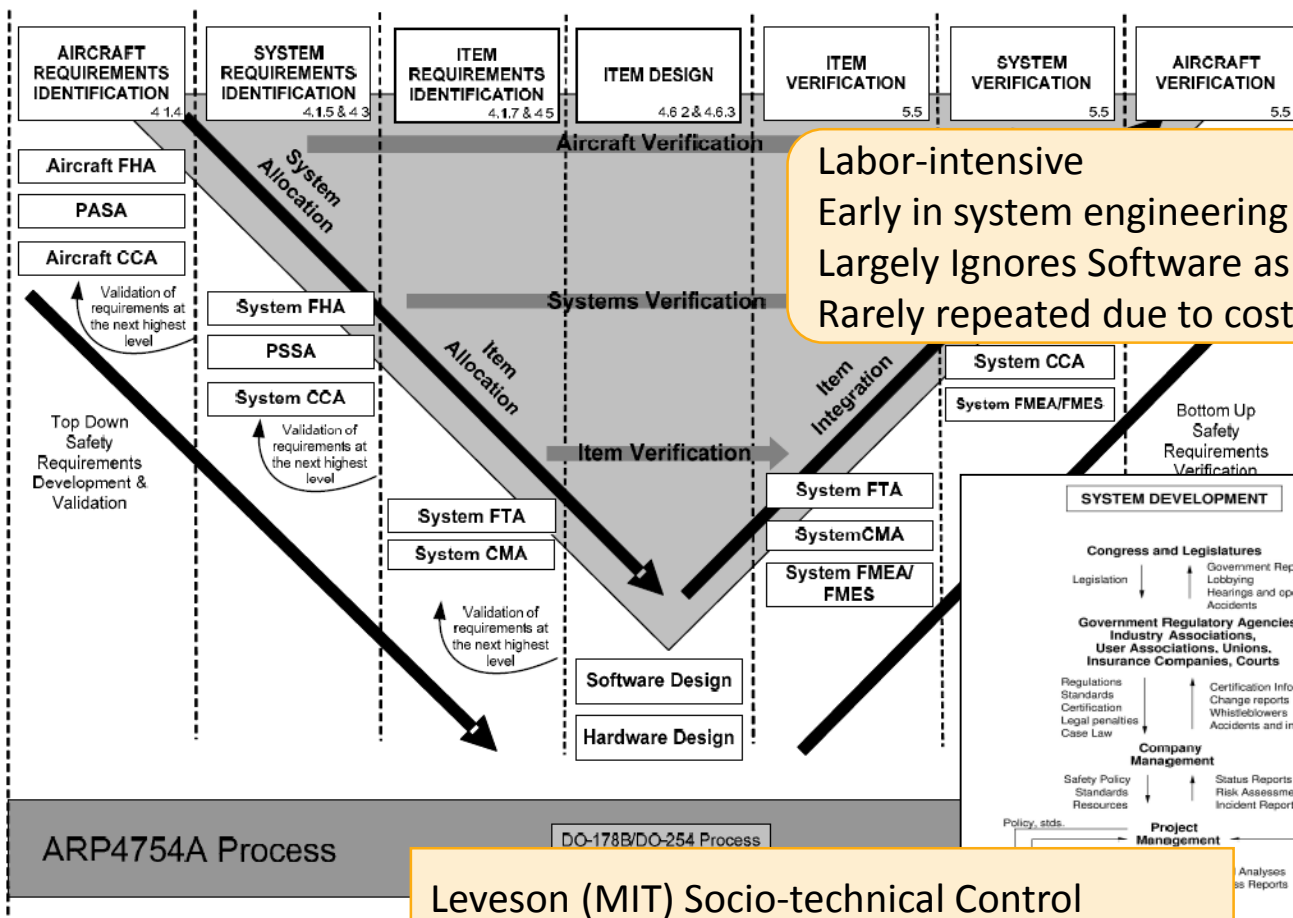

Overview of the ISO/IEC SC 7 Process Standards

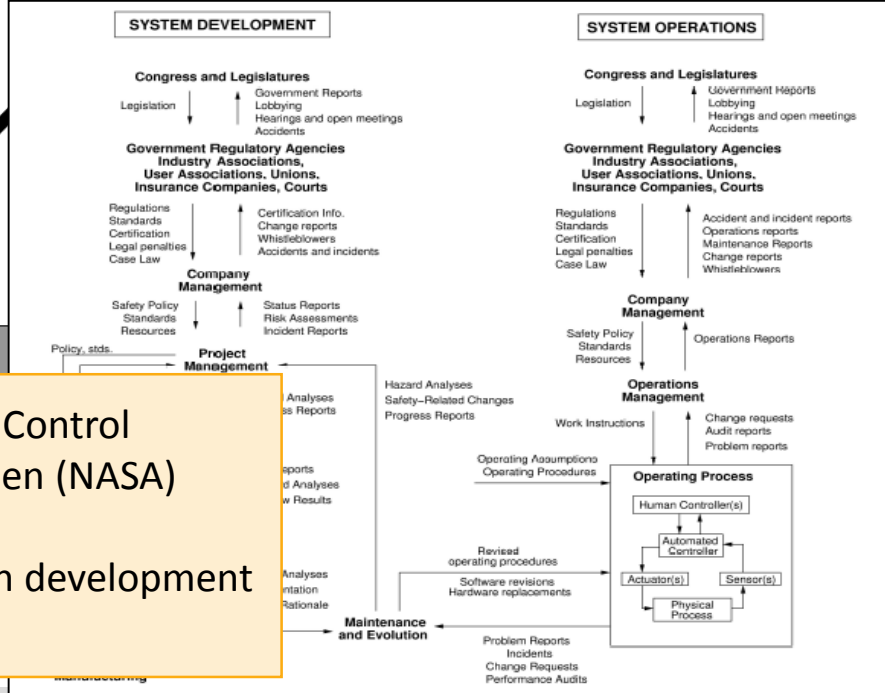

Process Standards

Safety Practice in Development Process Context

Labor-intensive
 Early in system engineering
 Largely Ignores Software as Hazard Source
 Rarely repeated due to cost

Leveson (MIT) Socio-technical Control Framework based on Rasmussen (NASA) model of risk management
 Multiple hazard contributors in development and operational context

We Rely on Software for Safe Aircraft Operation

Quantas Airbus A330-300 Forced to make Emergency Landing - 36 Injured

Written by htbw on Oct-7-08 1:48pm
From: soyawannaknow.blogspot.com

Thirty-six people were injured in a mid-air emergency landing Tuesday.

The terrifying incident saw the Airbus A330-300 issue a mayday call when it suddenly changed altitude during a flight from Singapore to Perth, Qantas said.

Embedded software systems introduce a new class of problems not addressed by traditional system safety analysis

Oct. 15 (Bloomberg) -- **Airbus SAS** issued an alert to airlines after Australian investigators said a computer fault on a **Boeing 787** flight switched off the autopilot and generated false jet to nose dive.

The Airbus A330-300 was cruising at 37,000 feet (11,277 meters) when a computer fed incorrect information to the flight control system, **Australian Transport Safety Bureau** said yesterday. The plane descended 650 feet within seconds, slamming passengers and crew to the ceiling, before the pilots regained control.

"This appears to be a unique event," the bureau said, adding that Airbus, the Toulouse, France-based Airbus, the world's largest maker of commercial aircraft, issued a telex late yesterday to airlines that fly Airbus aircraft fitted with the same air-data computer. The advisory is aimed at minimizing the risk in the unlikely event of a similar occurrence.

FAA says software problem with Boeing 787s could be catastrophic

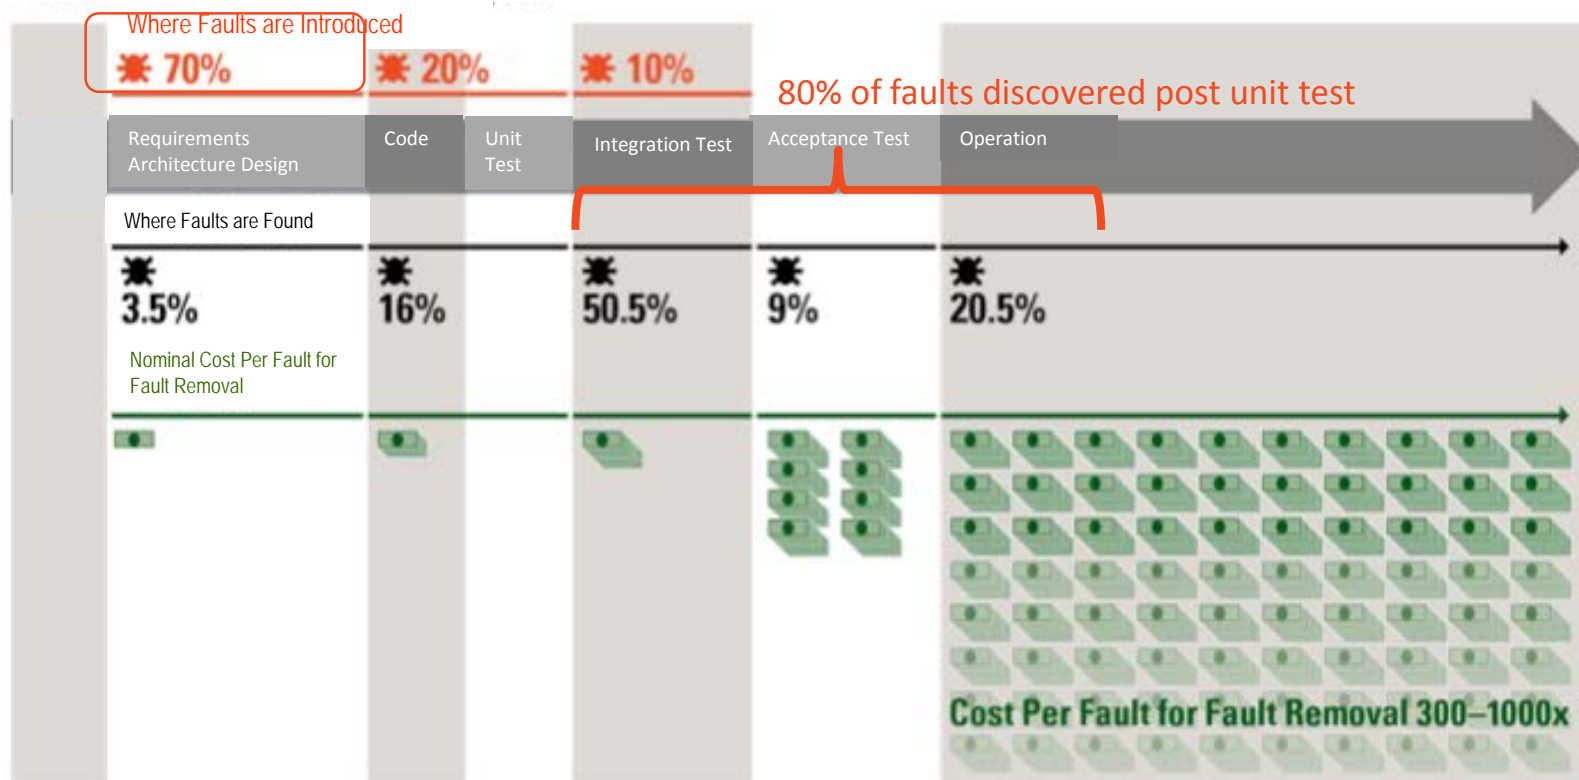

By **Dan Catchpole**
[@dcatchpole](https://twitter.com/dcatchpole)

The Federal Aviation Administration says a software problem with Boeing 787 Dreamliners could lead to one of the most advanced jetliners losing electrical power in flight, which could lead to loss of control.

- The Buzz:** Hipster's dilemma
- Boeing & aerospace news
- Aerospace blog

The FAA notified operators of the airplane Friday that if a 787 is powered continuously for 248 days, the plane will automatically shut down its alternating current (AC) electrical power.

Safety Critical Software System Challenges

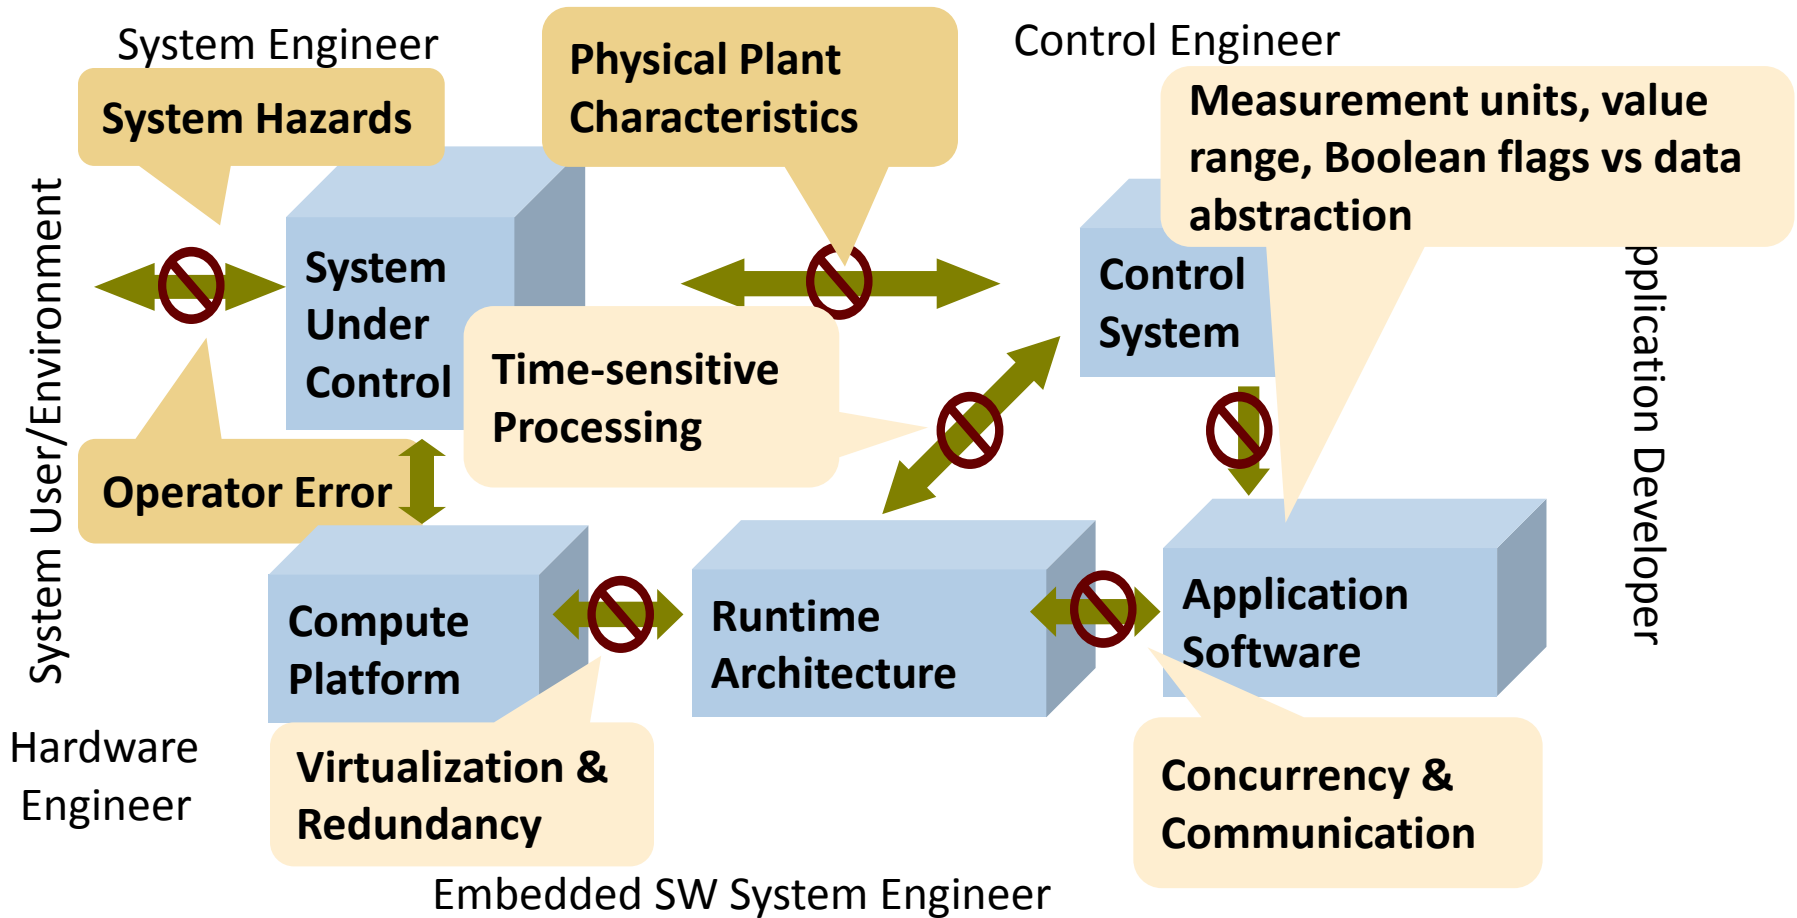

Sources: Critical Code; NIST, NASA, INCOSE, and Aircraft Industry Studies

Post-unit test software rework cost 50% of total system development cost & growing

Recertification cost is not proportional to system changes

Mismatched Assumptions in Safety-Critical System Interactions

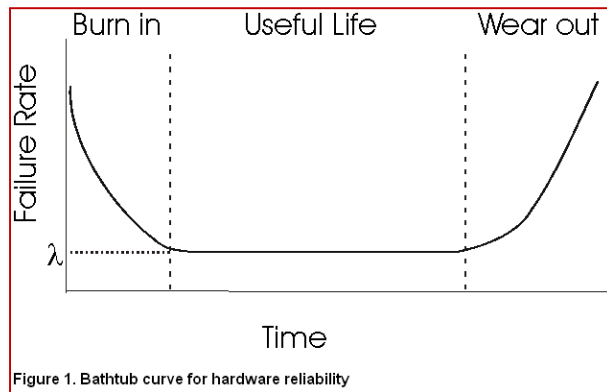

Embedded software system as major source of hazards

Why do system level failures still occur despite fault tolerance techniques being deployed in systems?

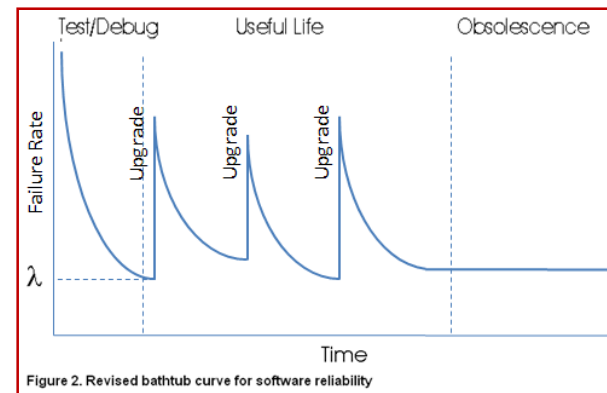

Software Reliability

Observations

- Software reliability does not adhere to the bathtub failure rate curve for hardware

Lifespan of single design and physical product

Multi-release error rate of operating systems

- Software errors are design errors
- Software is not perfectable (unreasonable Zero defect assumption)
- Software is sensitive to operational context; testing has limited effectiveness

In a given use scenario the software defect is triggered every time

Improve Quality
 Analytical verification
 Coverage of exceptional conditions
 Resilience to software defects

Operator Error Statistics

80% of accidents identified as due to pilot/operator errors

- References: <http://www.vtol.org/safety.html> (AF, Army), Leveson & other studies
- Result of single root cause event chain & focus on blame
- Operational procedures are not always in line with actual system operation
- Up to 75% of time dealing with operational work-around procedures instead of correcting the problem in software

Need for re-certification cost reduction

Challenges in Safety-Critical Digital Systems

Embedded software system as major hazard source

- High interaction complexity, mismatched assumptions, mode confusion
- Accidents due to combinations of major and minor hazard contributors

System safety analysis

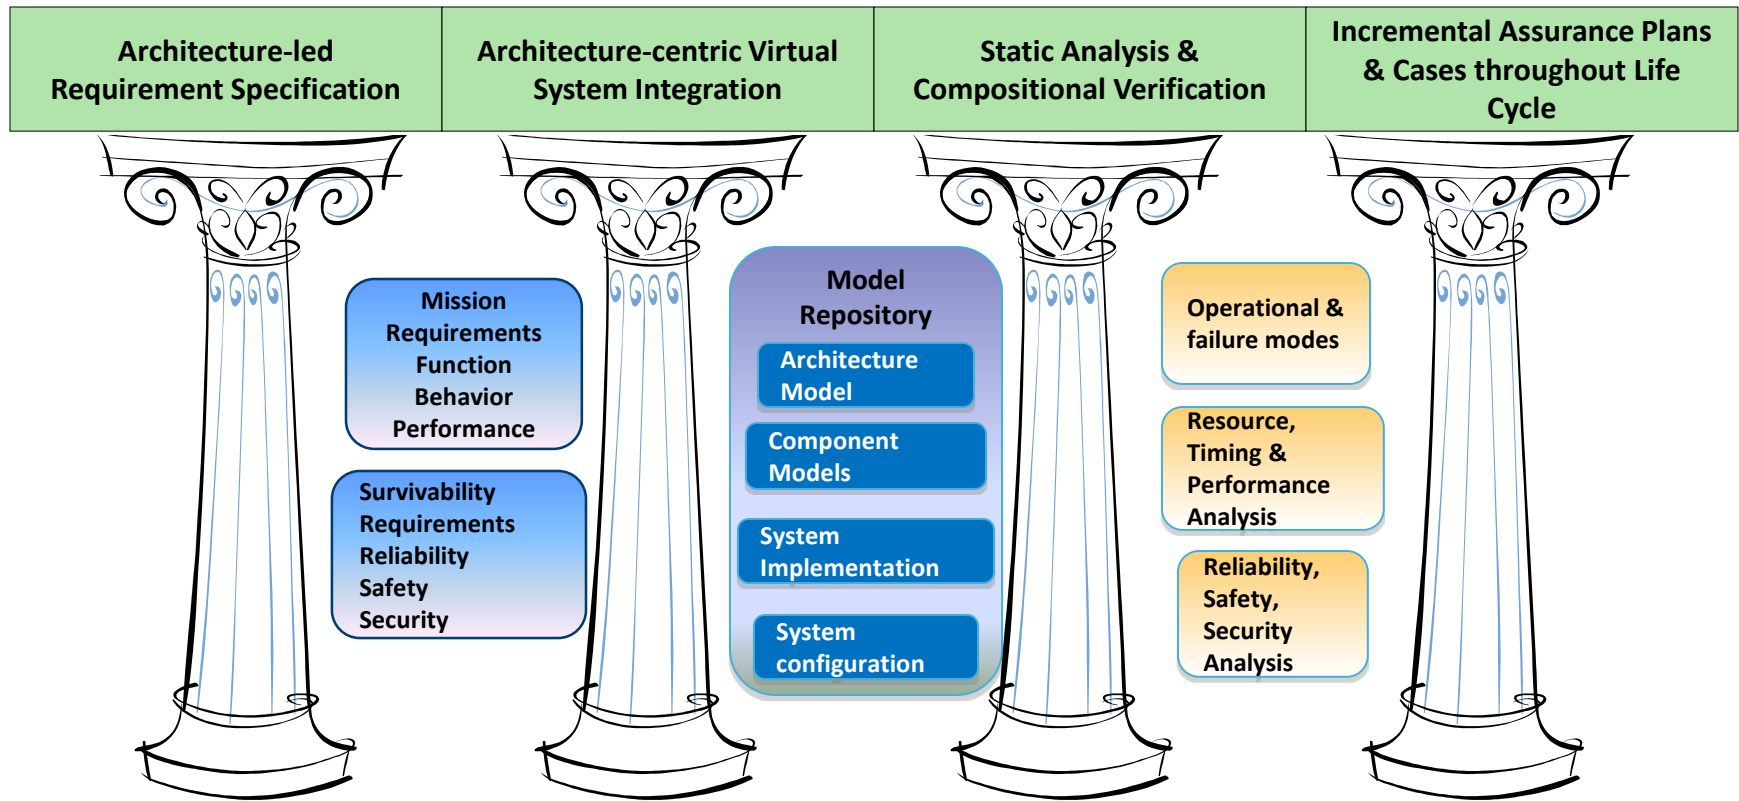

- Safety engineering largely viewed as a system engineering practice
- Safety analysis processes are labor-intensive
- Consistency between evolving architecture design and safety analysis models

Software Solutions Symposium 2017

Virtual System Integration and Verification

Reliability & Qualification Improvement Strategy

2010 SEI Study for AMRDEC
Aviation Engineering Directorate

Four pillars for Improving Quality of Critical Software-reliant Systems

Software for Dependable Systems: Sufficient Evidence? (National Research Council Study)

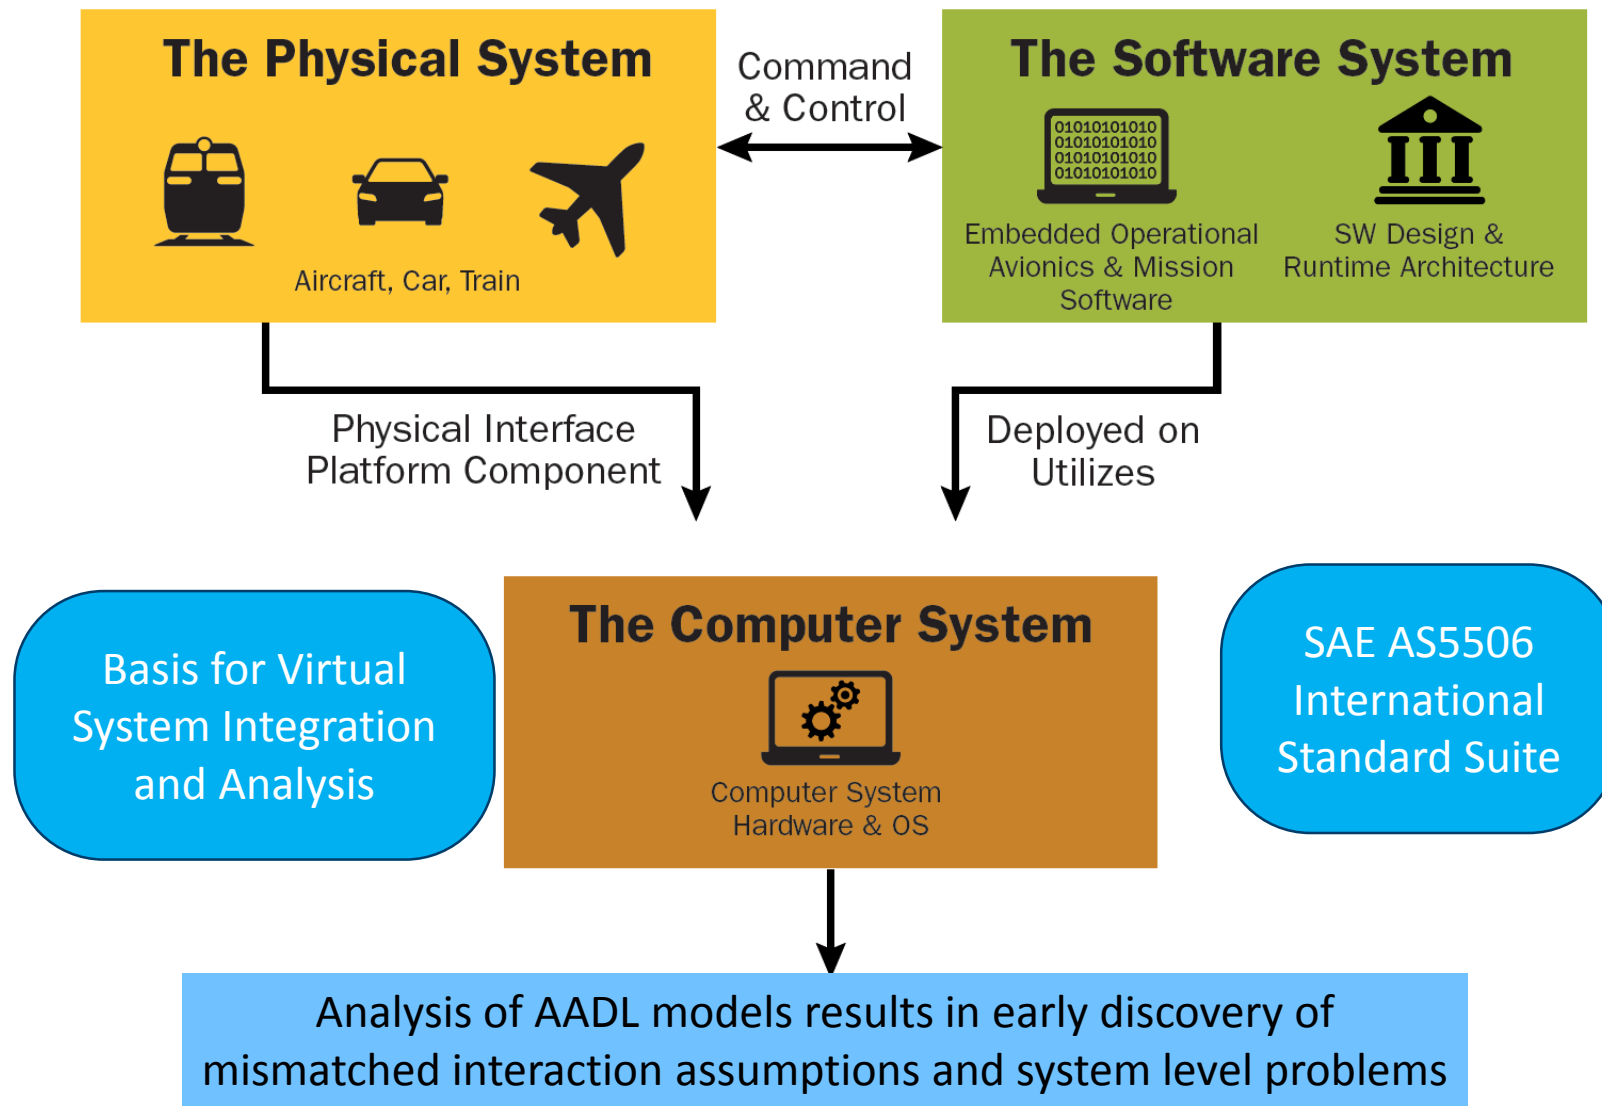

Testing is indispensable **BUT**

- “A rigorous development process in which testing and code review are the only verification techniques cannot justify claims of extraordinarily high levels of dependability”
- “Execution of even a large set of end-to-end tests, even with high levels of code coverage, in itself says little about the dependability of the system as a whole.”
- “For testing to be a credible component of a [case for dependability], the relation between testing and properties claimed will need to be explicitly justified”
- “Credible claims of dependability are usually impossible or impractically expensive to demonstrate after design and development are complete”

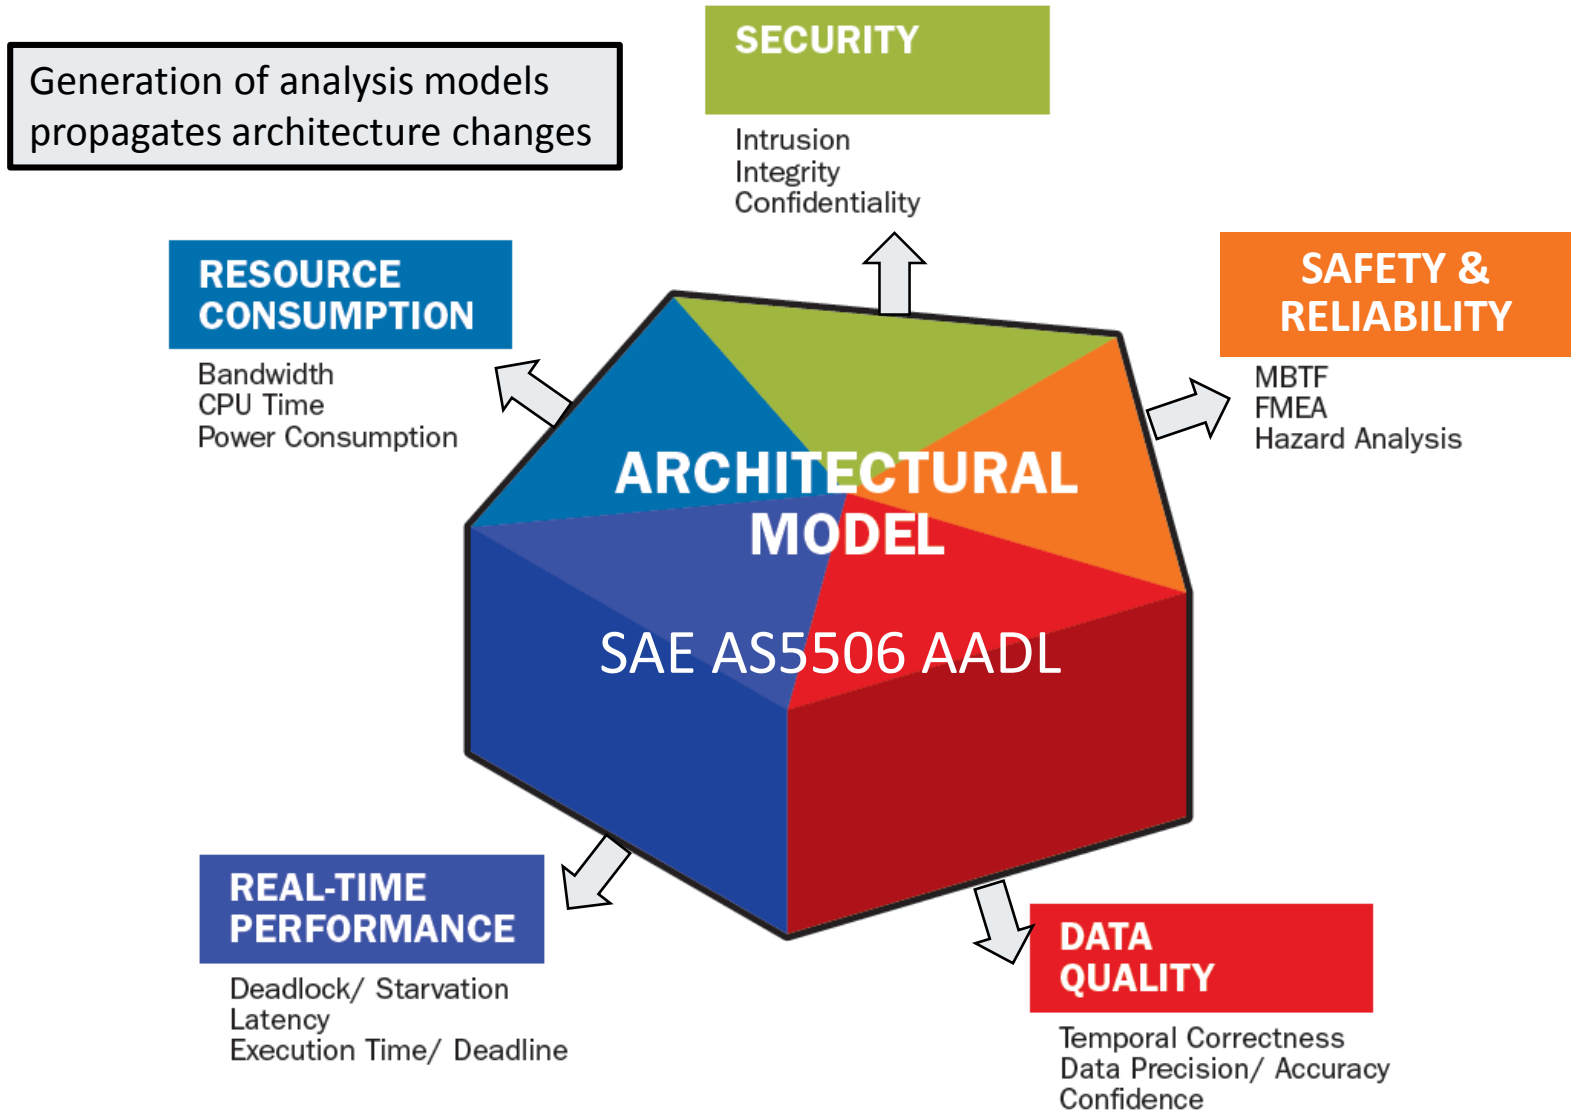

Assurance that a system is dependable requires the construction and evaluation of a “dependability case”

- Claims, arguments, evidence, expertise

Automation of Safety Analysis

Why Safety & Reliability Analysis Automation

Current process is

- Labor-intensive, years between repetition
- Prone to inconsistencies with evolving architecture and other analyses
- Requires knowledge of Markov, Petri net, and other notations

Early automation experiments with AADL

Steven Vestal, Honeywell, MetaH, Error Model, AADL committee, Avionics system trade studies during bidding (1999-)

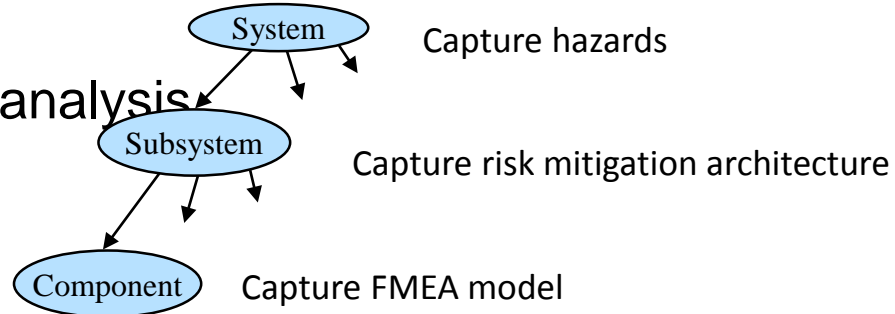

Myron Hecht, Aerospace Corp., member of AADL & DO-178C committee, Automated safety analysis of several satellite systems for JPL (2009-)
FMEA with 26,000 failure modes and 25 levels of effects

Thomas Noll, University of Aachen, COMPASS project, Automated safety analysis and verification of satellite systems for ESA (2008-)

AADL Error Model Scope and Purpose

System safety process uses many individual methods and analyses, e.g.

- hazard analysis
- failure modes and effects analysis
- fault trees
- Markov processes

Goal: a general facility for modeling fault/error/failure behaviors that can be used for several modeling and analysis activities.

Annotated architecture model permits checking for **consistency and completeness** between these various declarations.

Related analyses are also useful for other purposes, e.g.

- maintainability
- availability
- Integrity
- Security

SAE ARP 4761 Guidelines and Methods for Conducting the Safety Assessment Process on Civil Airborne Systems and Equipment
Demonstrated in SAVI Wheel Braking System Example

 Reliability/Availability (Markov Chain/Dependence Diagram)

Function Name	Failure Mode	Failure Rate (G/B)	Flight Phase	Failure Effect	Detection Method	Comments
+5 Volt	+5V out of spec.	0.2143	All	Possible PIS shutdown	Power Supply Monitor trips, shuts down supply and passes "invalid power supply (PIS)" to other BSCU system	BSCU channel fails
	+5V short to ground	0.2857	All	PIS shutdown	Power supply monitor passes invalid PIS to other BSCU system	BSCU channel fails
	Loss of / reduced filtering	0.3571	All	Increase Ripple	May pass out of spec voltage to rest of BSCU if ripple is such that it is not detected by the PIS monitor	May cause spurious PIS monitor trip
	+5V open	0.5714	All	PIS shutdown	Power supply monitor passes invalid PIS to other BSCU system	BSCU channel fails
Total Failure Rate of +5V Supply	No Effect	0.1429	All	No Effect	None/No Effect	No Effect

Error Model V2 Annotations of AADL Model

Three levels of abstraction expressed by EMV2

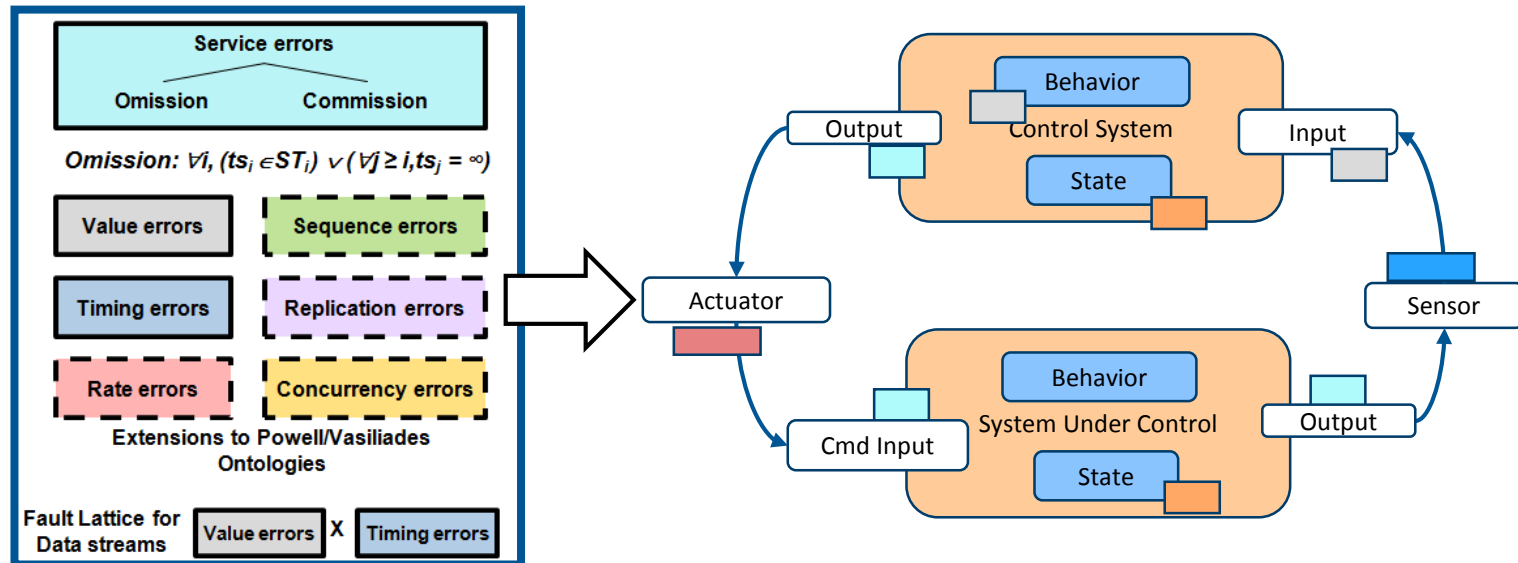

- Focus on fault propagation across components
 - Probabilistic error sources, sinks, paths and transformations
 - Fault propagation and Transformation Calculus (FPTC) from York U.
- Focus on fault behavior of components
 - Probabilistic typed error events, error states, propagations
 - Voting logic, error detection, recovery, repair
- Focus on fault behavior in terms of subcomponent fault behaviors
 - Composite error behavior state logic maps states of parts into (abstracted) states of composite

```

Virtual integration of architecture fault models recording SIL test observations detects unhandled fault.

Software Solutions Symposium 2017

Automated Fault Tree and Common Cause Analysis

Automated Fault Tree Analysis from AADL Models

Fault tree generation from annotated AADL model

- AADL focuses on embedded software systems
- Error Model V2 Annex specifies error behavior at three levels of abstraction
- Architecture design changes are consistently reflected in fault tree

Use of fault propagation taxonomy

- Bounded set of failure effect types
- Taxonomy coverage
- Error propagation contracts and unhandled faults

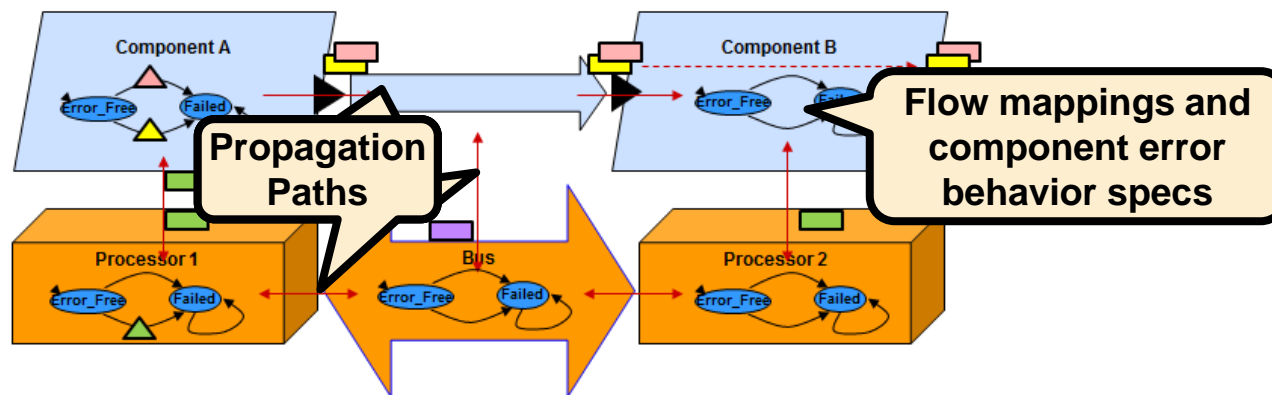

Common cause failure contributors

- Identification of fan-out in propagation paths
- Transformation of generated fault graph to eliminate/reduce dependent fault tree events

Propagation and Recovery Dependency Graph

AADL core model provides propagation paths

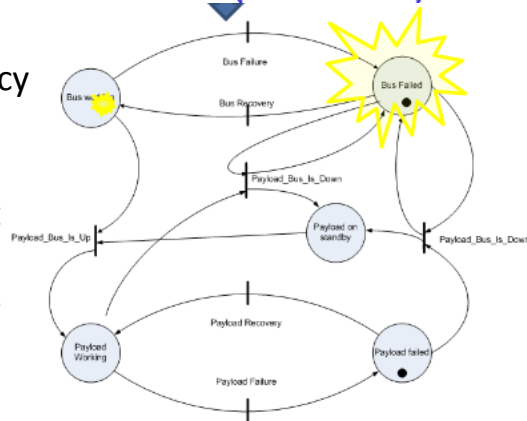

- Port connections, access connections, remote service calls
- Deployment binding of SW to HW

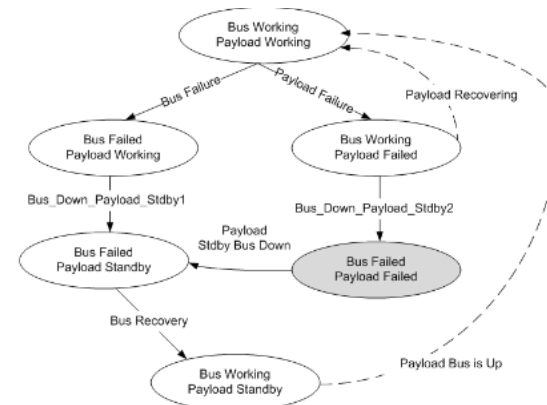

Abstracted dependency graph

Example: Petri net

OSATE2 uses compact propagation graph derived from instance model

Resulting impact trace

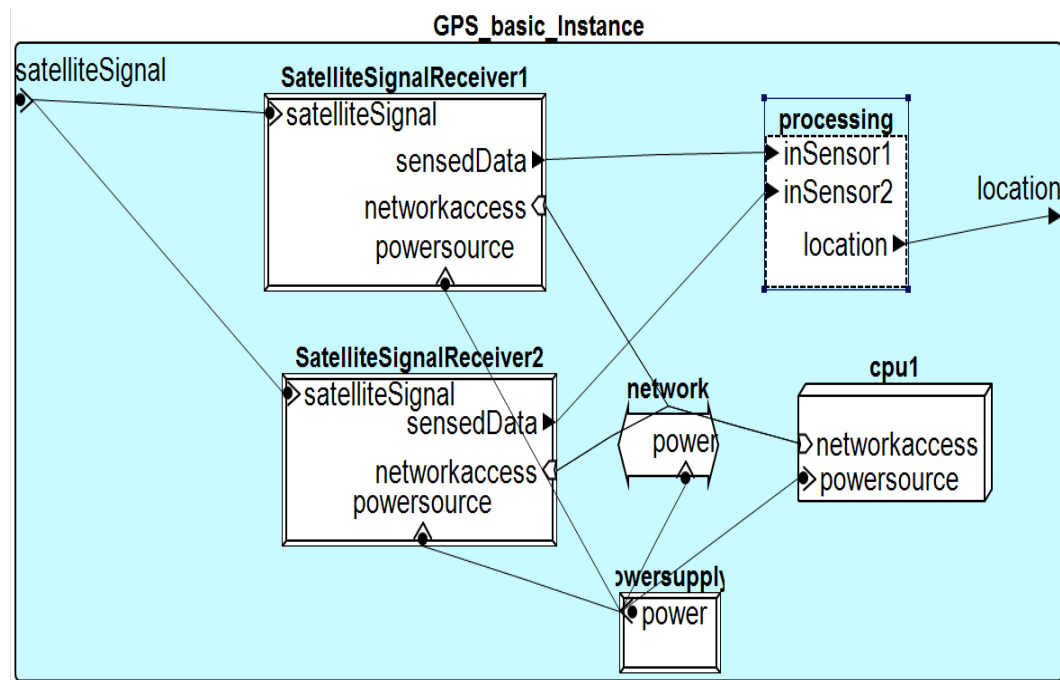

Example System: GPS

Dual redundant satellite signal receivers

- One is sufficient for less precise location output

Single power supply

- Common cause failure source

Error Propagation Specification

```

abstract GPSProcessing
features
  inSensor1: in data port;
  inSensor2: in data port;
  location: out data port;
annex EMV2 {**
use types ErrorLibrary, GPSErrorLibrary;
error propagations
  inSensor1 : in propagation {ServiceOmission};
  inSensor2 : in propagation {ServiceOmission};
  location : out propagation {ServiceOmission, LowPrecisionData, IncorrectData};
  processor: in propagation {ServiceOmission};
flows
  s1toloc: error path inSensor1{ServiceOmission} -> location{ServiceOmission};
  s2toloc: error path inSensor2{ServiceOmission} -> location{ServiceOmission};
  ptoloc: error path processor{ServiceOmission} -> location{ServiceOmission};
  gpssrc: error source location{LowPrecisionData, IncorrectData};
end propagations;
**};
end GPSProcessing;

```

Out propagation of
different error types

Error paths include propagation
from processor binding

Component Error Behavior Specification

```

abstract GPSProcessing_computeError extends GPSProcessing
annex EMV2 {**
  use types ErrorLibrary, GPSErrorLibrary;
  use behavior GPSErrorLibrary::GPSProcessingFailed;
  component error behavior
  events
    computeError: error Event;
  transitions
    internal: Operational -[computeError]-> Incorrect;
    lowPrecision: Operational| -[inSensor1{ServiceOmission}
      or inSensor2{ServiceOmission}]-> LowPrecision;
    inputNoService: all -[inSensor1{ServiceOmission}
      and inSensor2{ServiceOmission}]-> NoService;
    CPUNoService: all -[processor {ServiceOmission}]-> NoService;
  propagations
    outNoService: NoService-[]-> location{ServiceOmission};
    outLowPrecision: LowPrecision-[]-> location{LowPrecisionData};
    outComputeErrorEffect: Incorrect-[]-> location{IncorrectData};
  end component;
  properties
    emv2::OccurrenceDistribution => [ ProbabilityValue => 7.5e-4 ;
      Distribution => Poisson;
    ] applies to computeError;
  **};
end GPSProcessing_computeError;

```

Failure modes and handling of different error types

Handling Common Cause Failure Source

Propagation path fan out identifies common cause source

Transformations on common cause elements

Move common event up

(SSR1 or PS) and (SSR2 or PS)

=> PS or (SSR1 and SSR2)

Absorb subgate with common event

(SSR1 or PS) and PS => PS

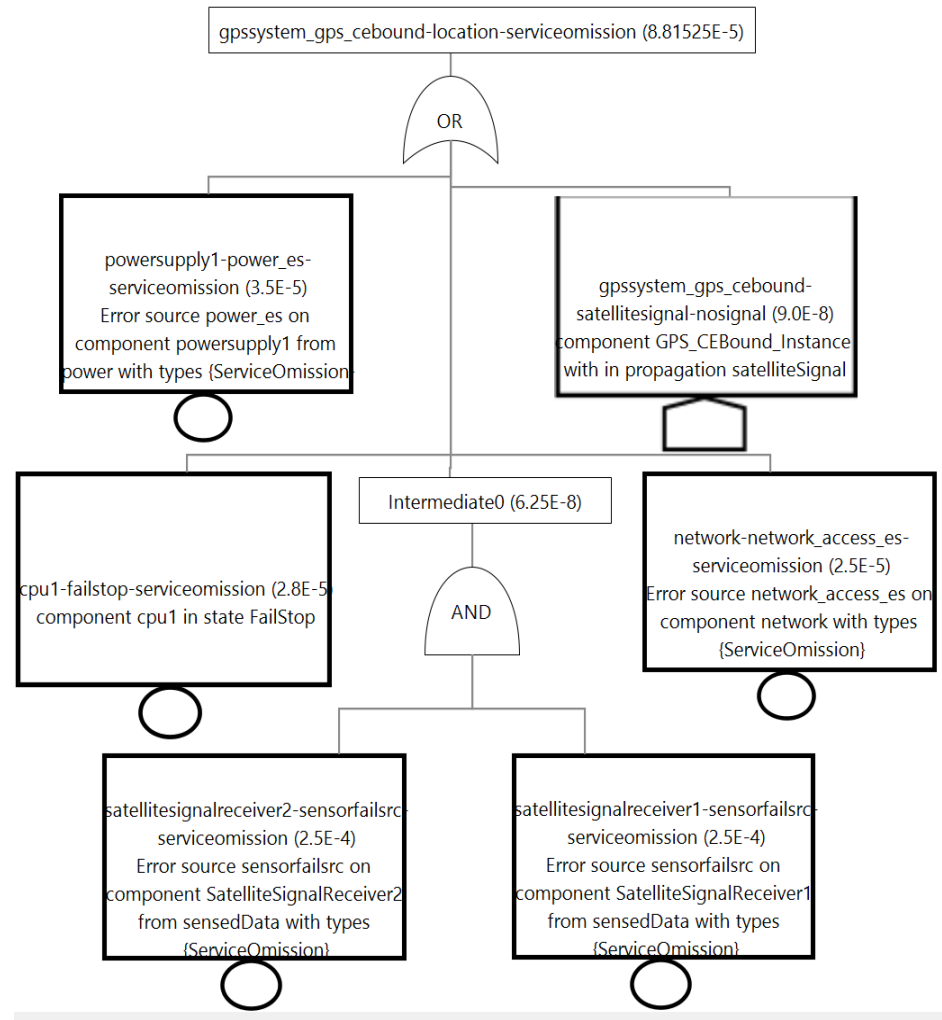

Eliminate replicate events

PS or PS => PS

Flatten nested gates

$E1 \text{ or } (E2 \text{ or } E3) \Rightarrow \text{or}\{E1, E2, E3\}$

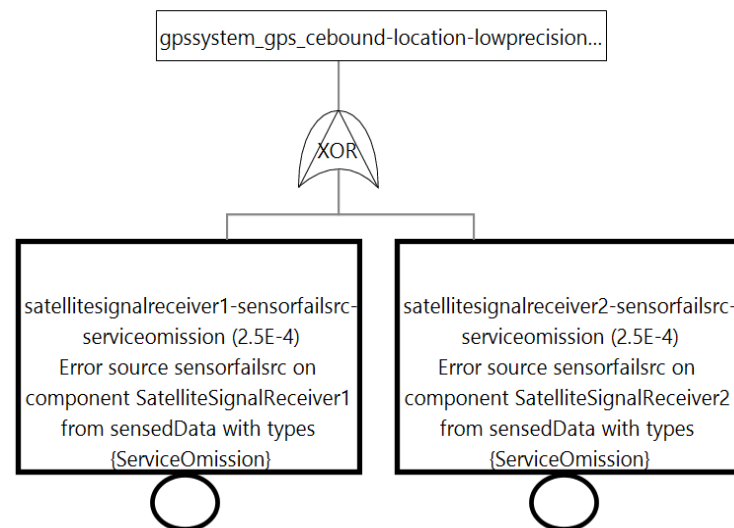

Elimination of dependent events simplifies occurrence probability calculation

Fault Tree for Degraded Mode

Condition: only one receiver fails

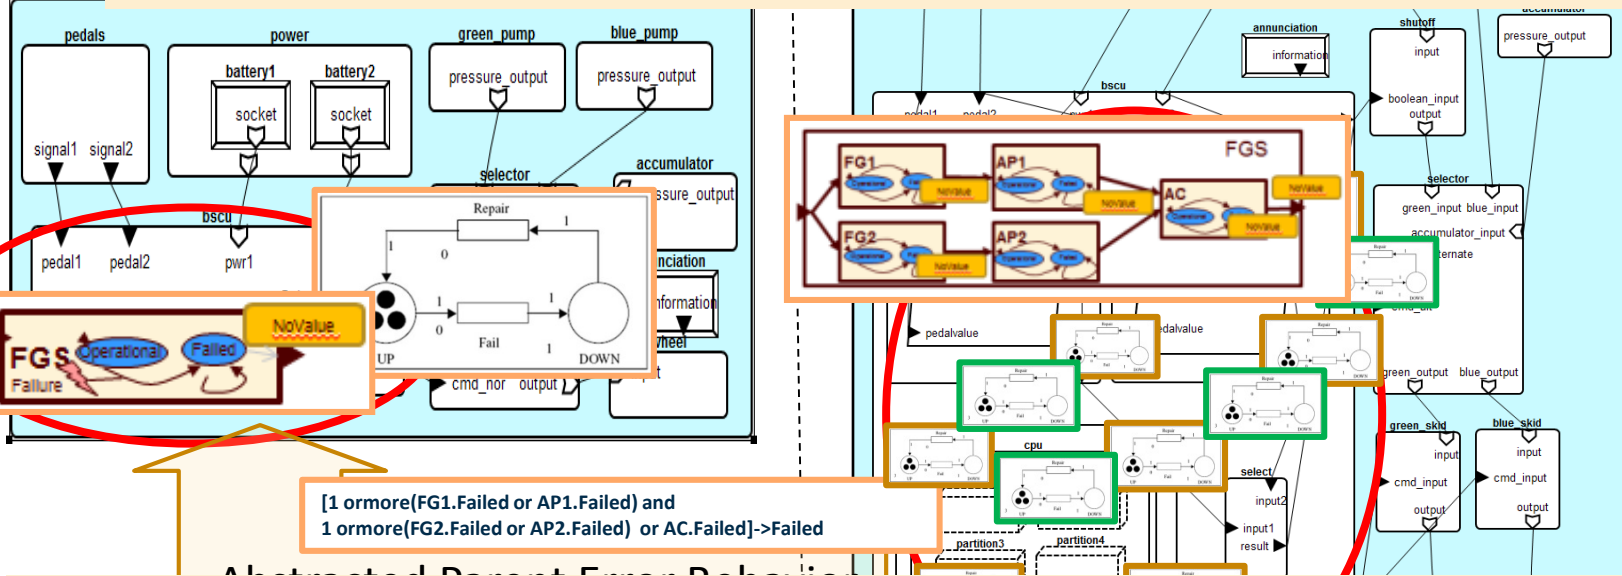

- Cannot include common cause contributors

Scalability and Incremental Safety Analysis

Abstract and Composite Error Model Specification at each architecture layer

Reduce state-space through layered abstraction

Consistency of abstract specification compositional specification and implementation fault models

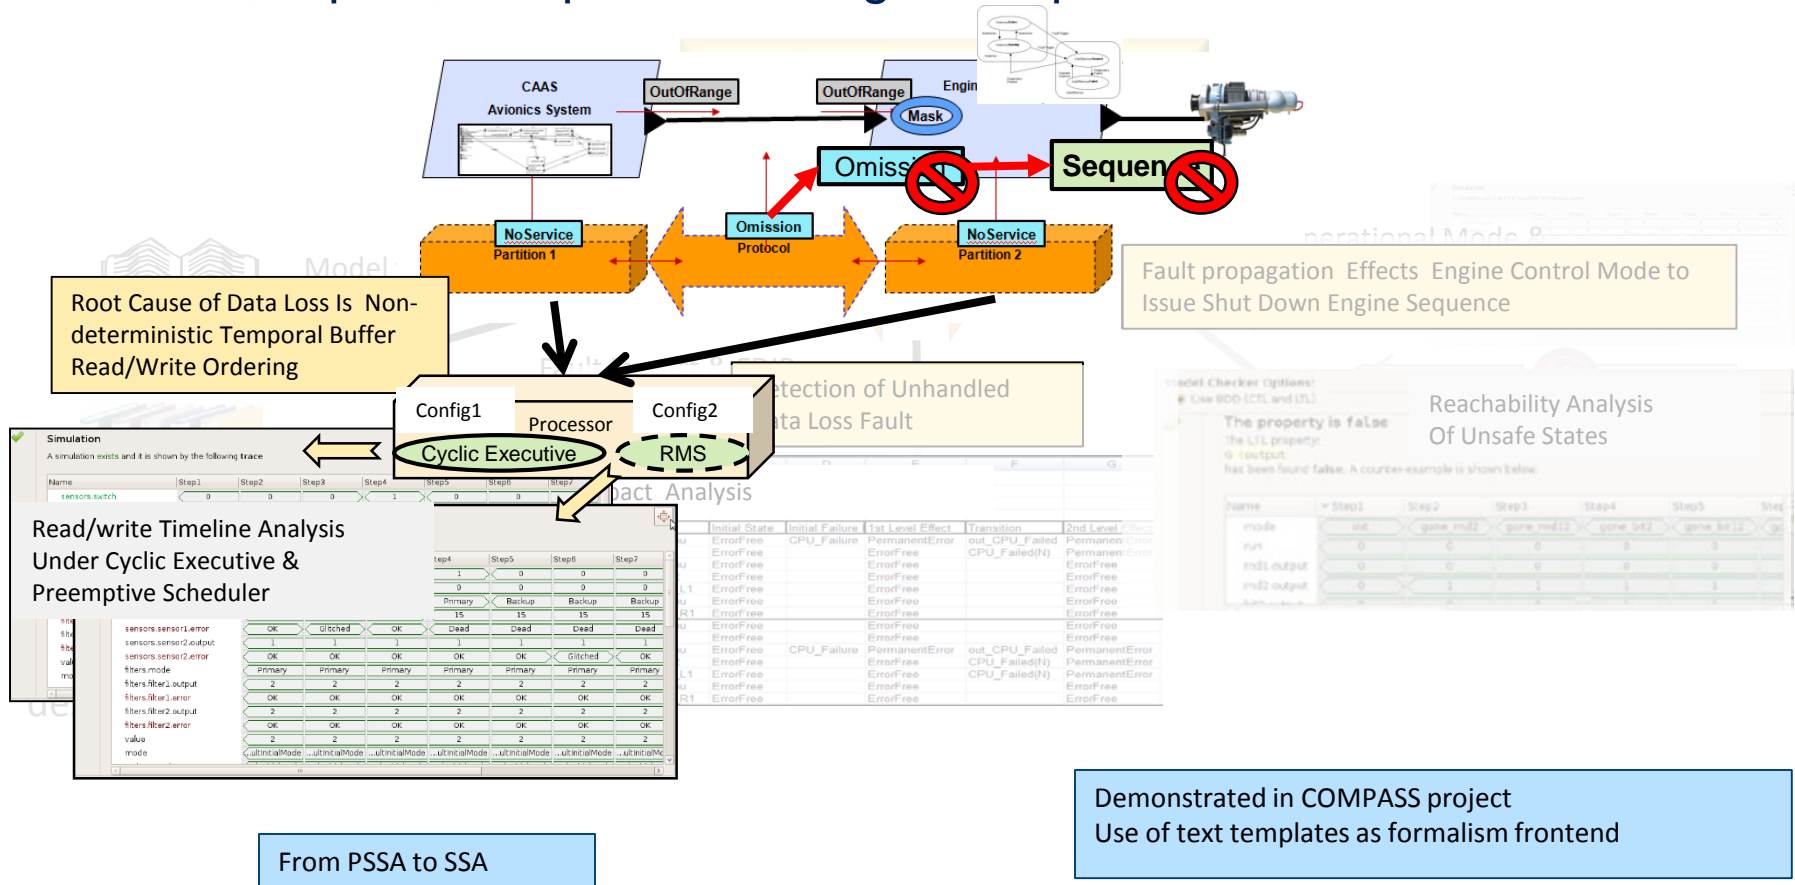

[1 ormore(FG1.Failed or AP1.Failed) and 1 ormore(FG2.Failed or AP2.Failed) or AC.Failed]->Failed

Abstraction across one or more architecture layers/tiers

Understanding the Cause of Faults

Through model-based analysis identify architecture induced unhandled, testable, and untestable faults and understand root causes, contributing factors, impact, and potential mitigation options.

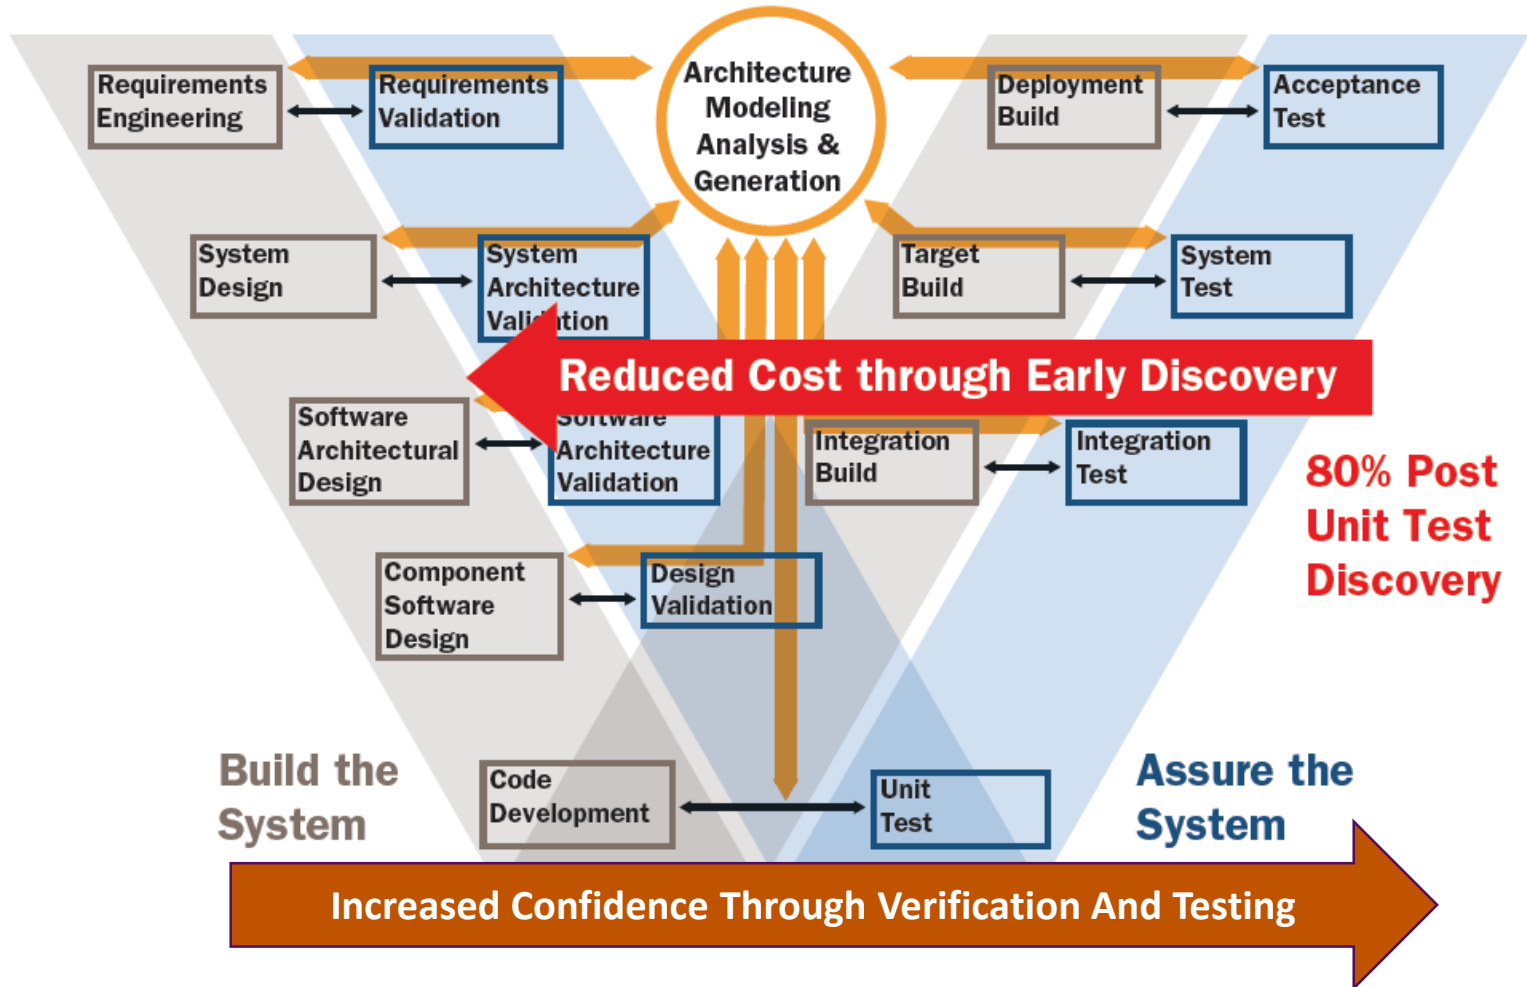

Benefits of Safety Analysis Automation

Automation allows for

- Early identification of potential problems
 - Single points of failure
 - Unanticipated effects
- Larger set of failure modes and combinations
- More levels of effects
- Safety analysis of system and software architecture
- More frequent re-analysis
- Architecture trade studies
- Consistency across analysis results

Benefits of Virtual System Integration & Incremental Lifecycle Assurance
